Regolith and Landscapes in Eastern Australia

Edited by Ian C. Roach
Front Cover:
Looking east from Cockburn, SA, towards the Mundi Mundi rangefront on the western edge of the Barrier Ranges, near Broken Hill, NSW. Regolith here consists of silt- and fine sand-sized colluvial sheetwash with quartz lag and minor aeolian silt. The chenopod shrubs pearl bluebush (Maireana sedifolia), black bluebush (Maireana pyramidata) and bladder saltbush (Atriplex vesicaria) grow in contour bands ('tiger stripes') typical of undisturbed sheetwash in much of arid inland Australia.
