CRC LEME is an unincorporated joint venture between The Australian National University,
University of Canberra, Australian Geological Survey Organisation and CSIRO Exploration and Mining
Headquarters: CRC LEME c/o CSIRO Exploration and Mining, Private Bag No 5, PO Wembley, Western Australia, 6913.

RESEARCH ARISING FROM CSIRO/AMIRA YILGARN REGOLITH GEOCHEMISTRY PROJECTS 1987-1996

In 1987, CSIRO commenced a series of multi-client research projects in regolith geology and geochemistry which were sponsored by companies in the Australian mining industry, through the Australian Mineral Industries Research Association Limited (AMIRA). The initial research program, "Exploration for concealed gold deposits, Yilgarn Block, Western Australia" had the aim of developing improved geological, geochemical and geophysical methods for mineral exploration that would facilitate the location of blind, buried or deeply weathered gold deposits. The program commenced with the following projects:

P240: Laterite geochemistry for detecting concealed mineral deposits (1987-1991). Leader: Dr R.E. Smith.
Its scope was development of methods for sampling and interpretation of multi-element laterite geochemistry data and application of multi-element techniques to gold and polymetallic mineral exploration in weathered terrain. The project emphasised viewing laterite geochemical dispersion patterns in their regolith-landform context at local and district scales. It was supported by 30 companies.

P241: Gold and associated elements in the regolith - dispersion processes and implications for exploration (1987-1991). Leader: Dr C.R.M. Butt.
The project investigated the distribution of ore and indicator elements in the regolith. It included studies of the mineralogical and geochemical characteristics of weathered ore deposits and wall rocks, and the chemical controls on element dispersion and concentration during regolith evolution. This was to increase the effectiveness of geochemical exploration in weathered terrain through improved understanding of weathering processes. It was supported by 26 companies.

These projects represented 'an opportunity for the mineral industry to participate in a multi-disciplinary program of geoscience research aimed at developing new geological, geochemical and geophysical methods for exploration in deeply weathered Archaean terrains'. This initiative recognised the unique opportunities, created by exploration and open-cut mining, to conduct detailed studies of the weathered zone, with particular emphasis on the near-surface expression of gold mineralisation. The skills of existing and specially recruited research staff from the Floreat Park and North Ryde laboratories (of the then Divisions of Minerals and Geochemistry, and Mineral Physics and Mineralogy, subsequently Exploration Geoscience and later Exploration and Mining) were integrated to form a task force with expertise in geology, mineralogy, geochemistry and geophysics. Several staff participated in more than one project. Following completion of the original projects, two continuation projects were developed.

P240A: Geochemical exploration in complex lateritic environments of the Yilgarn Craton, Western Australia (1991-1993). Leaders: Drs R.E. Smith and R.R. Anand.
The approach of viewing geochemical dispersion within a well-controlled and well-understood regolith-landform and bedrock framework at detailed and district scales continued. In this extension, focus was particularly on areas of transported cover and on more complex lateritic environments typified by the Kalgoorlie regional study. This was supported by 17 companies.

P241A: Gold and associated elements in the regolith - dispersion processes and implications for exploration (1991-1993). Leader: Dr. C.R.M. Butt.
The significance of gold mobilisation under present-day conditions, particularly the important relationship with pedogenic carbonate, was investigated further. In addition, attention was focussed on the recognition of primary lithologies from their weathered equivalents. This project was supported by 14 companies.

Most reports related to the above research projects were published as CRC LEME Open File Reports Series (Nos 1-74), with an index (Report 75), by June 1999. Publication now continues with release of reports from further projects.

P252: Geochemical exploration for platinum group elements in weathered terrain. Leader: Dr C.R.M. Butt.
This project was designed to gather information on the geochemical behaviour of the platinum group elements under weathering conditions using both laboratory and field studies, to determine their dispersion in the regolith and to apply this to concepts for use in exploration. The research was commenced in 1988 by CSIRO Exploration Geoscience and the University of Wales (Cardiff). The Final Report was completed in December 1992. It was supported by 9 companies.

P409: Geochemical exploration in areas of transported overburden, Yilgarn Craton and environs, WA.
Leaders: Drs C.R.M. Butt and R.E. Smith.
About 50% or more of prospective terrain in the Yilgarn is obscured by substantial thicknesses of transported overburden that varies in age from Permian to Recent. Some of this cover has undergone substantial weathering. Exploration problems in these covered areas were the focus of Project 409. The research was commenced in June 1993 by CSIRO Exploration and Mining but was subsequently incorporated into the activities of CRC LEME in July 1995 and was concluded in July 1996. It was supported by 22 companies.

Although the confidentiality periods of Projects P252 and P409 expired in 1994 and 1998, respectively, the reports have not been released previously. CRC LEME acknowledges the Australian Mineral Industries Research Association and CSIRO Division of Exploration and Mining for authority to publish these reports. It is intended that publication of the reports will be a substantial additional factor in transferring technology to aid the Australian mineral industry.

This report (CRC LEME Open File Report 107) is a second impression (second printing) of CSIRO, Division of Exploration and Mining Restricted Report 305R, first issued in 1996/12, which formed part of the CSIRO/AMIRA Project P409.

(Shaded area represents highest determined Au content in top 8 m).

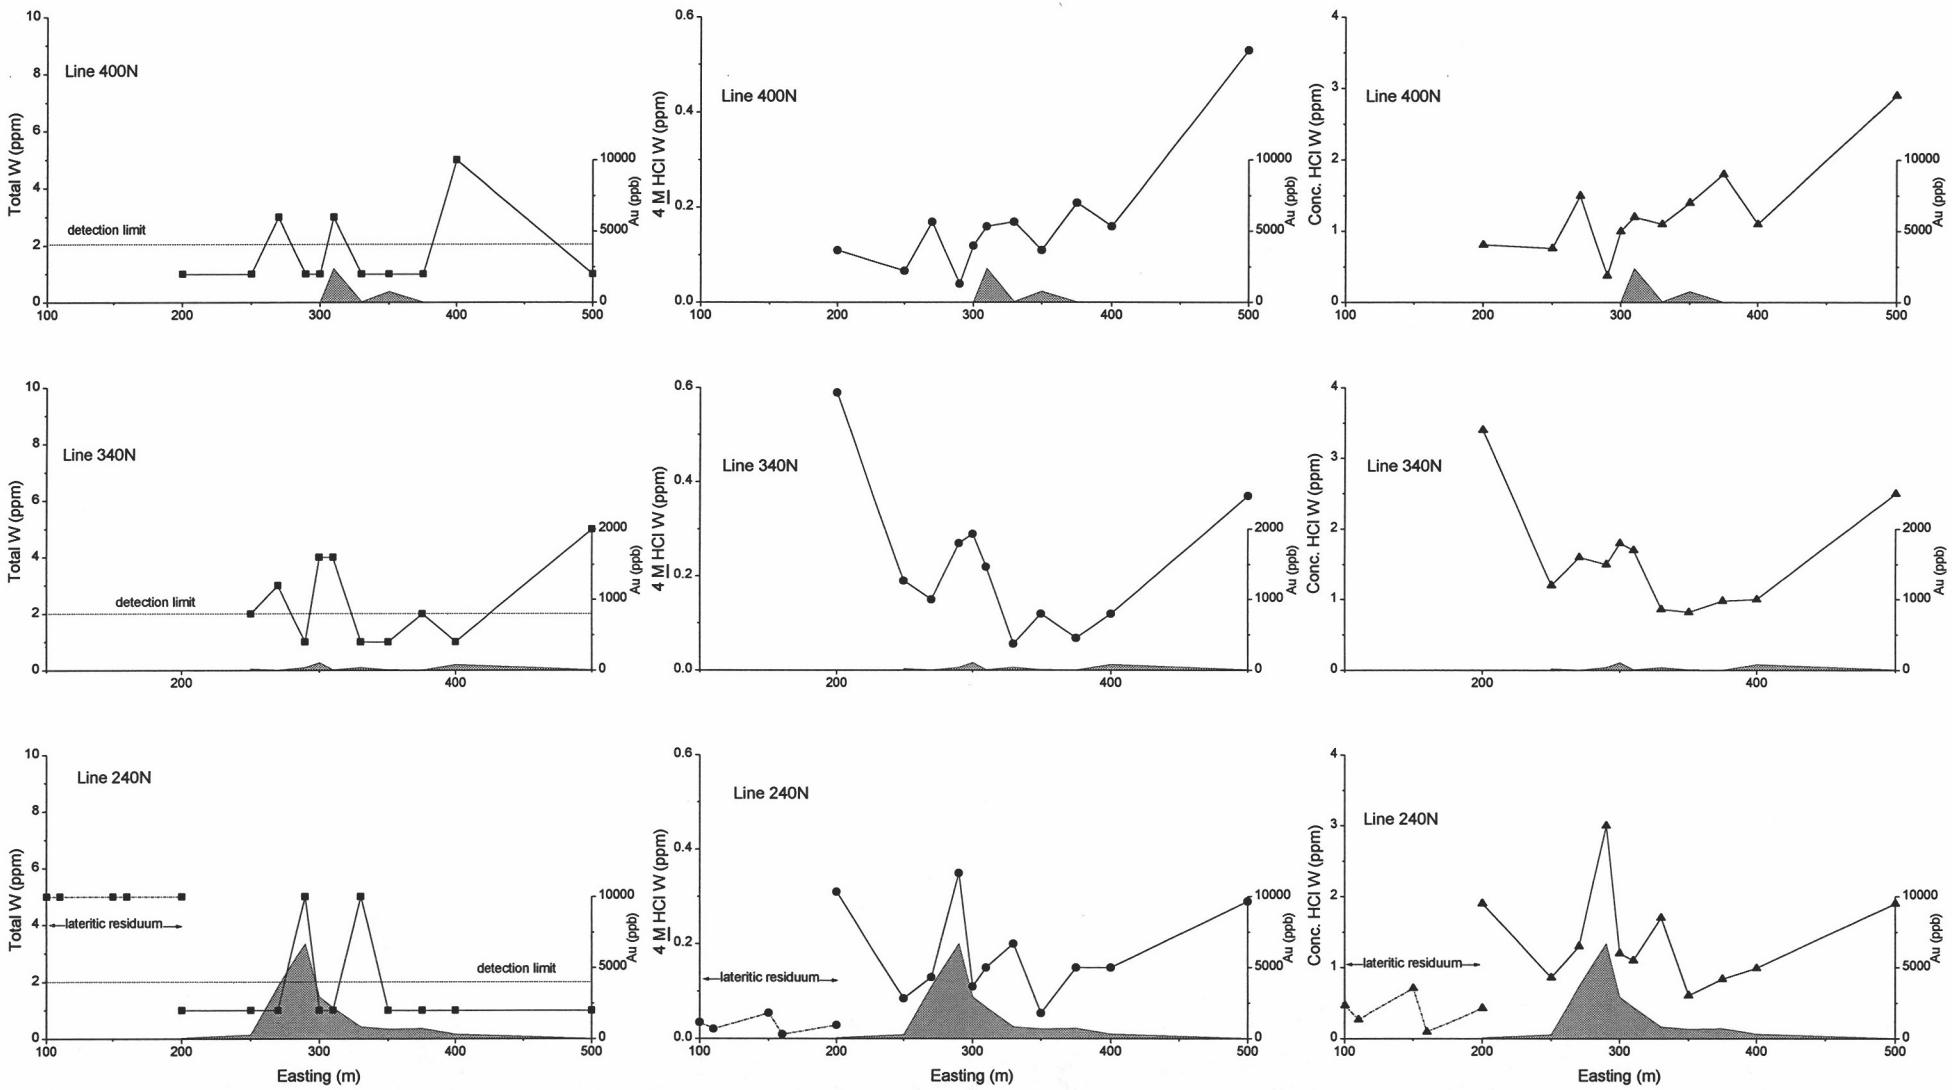

Figure A8.32: Total and HCl extractable W from Fender lines 400, 340 and 240 N.
(Shaded area represents highest determined Au content in top 8 m).

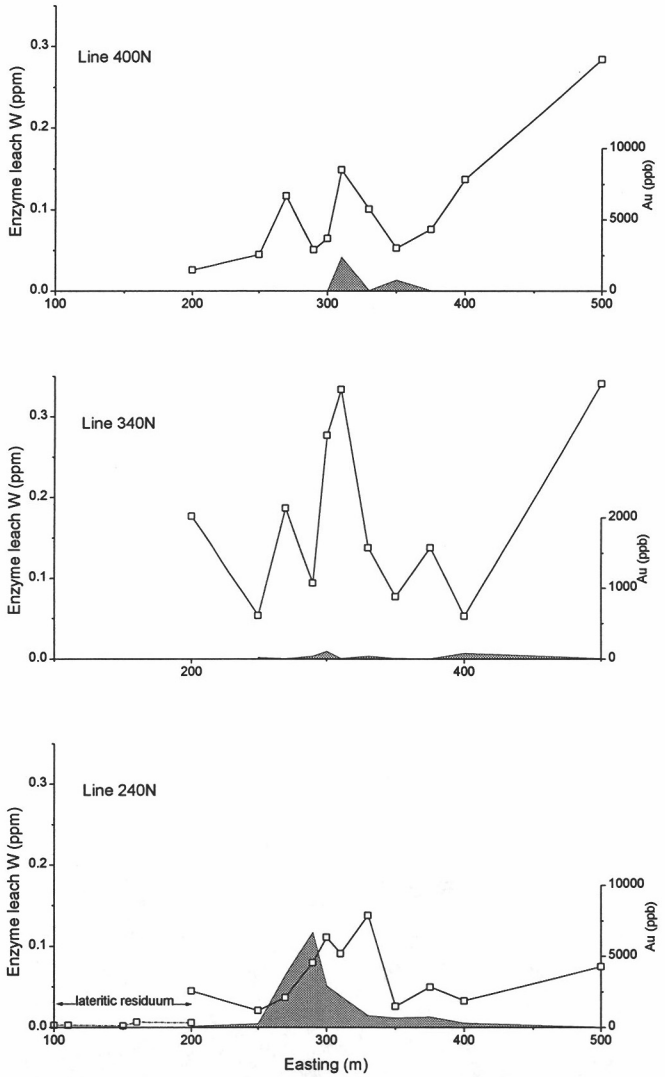

Figure A8.33: Enzyme leach W from Fender lines 400, 340 and 240 N (pH 5 acetate and hydroxylamine results below detection) . (Shaded area represents highest determined Au content in top 8 m).

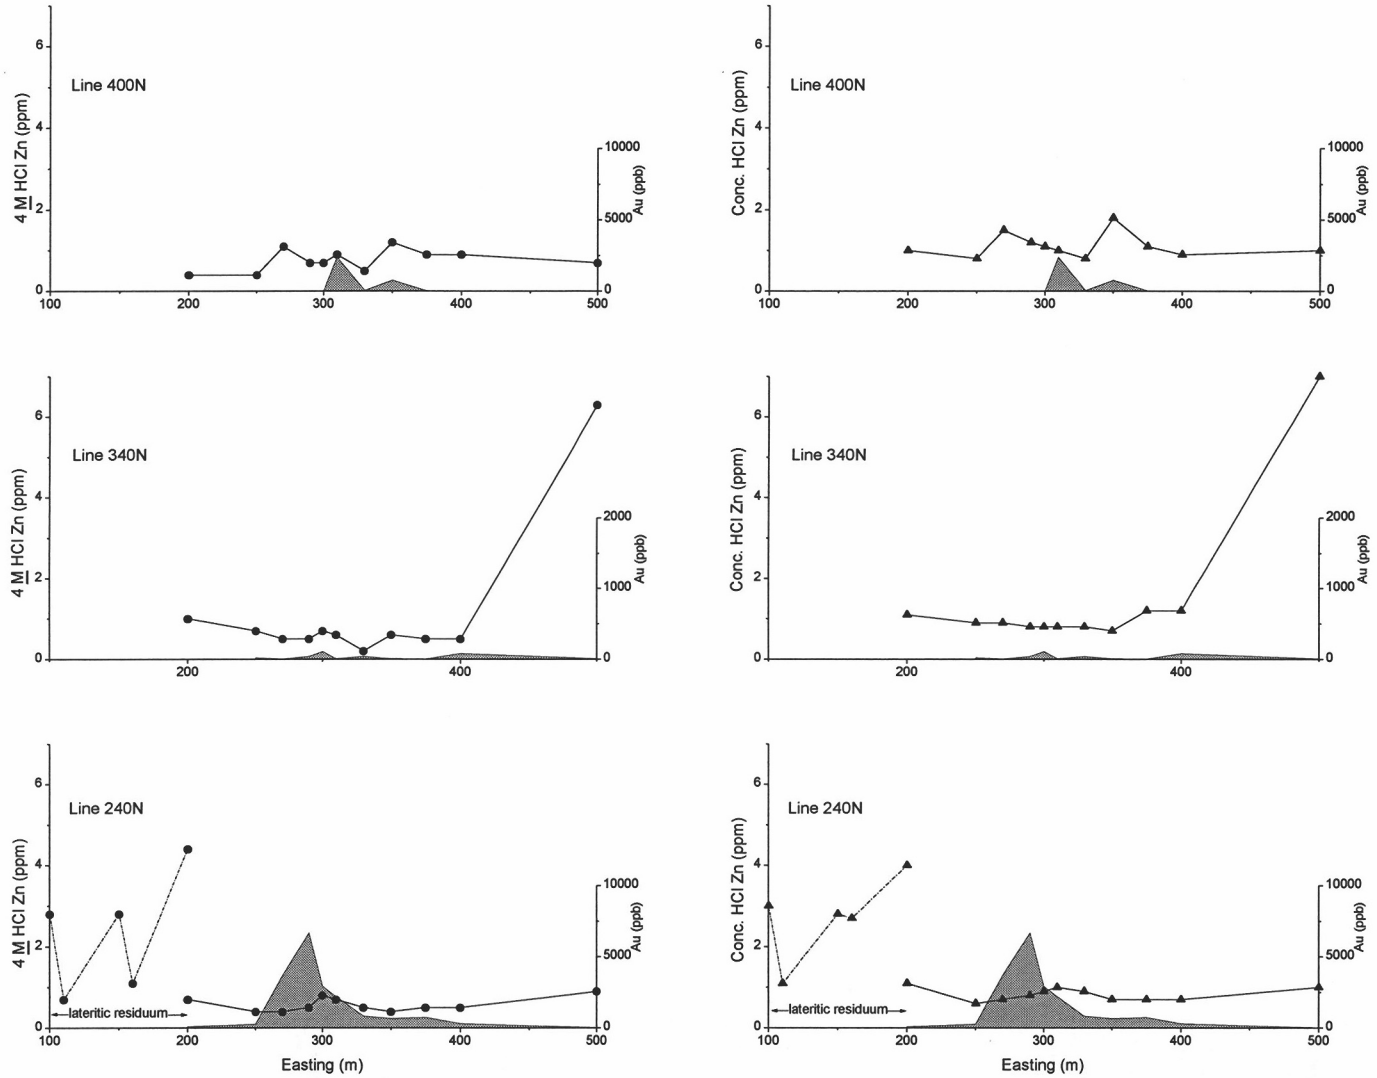

Figure A8.34: HCl extractable Zn from Fender lines 400, 340 and 240 N.
(Shaded area represents highest determined Au content in top 8 m).

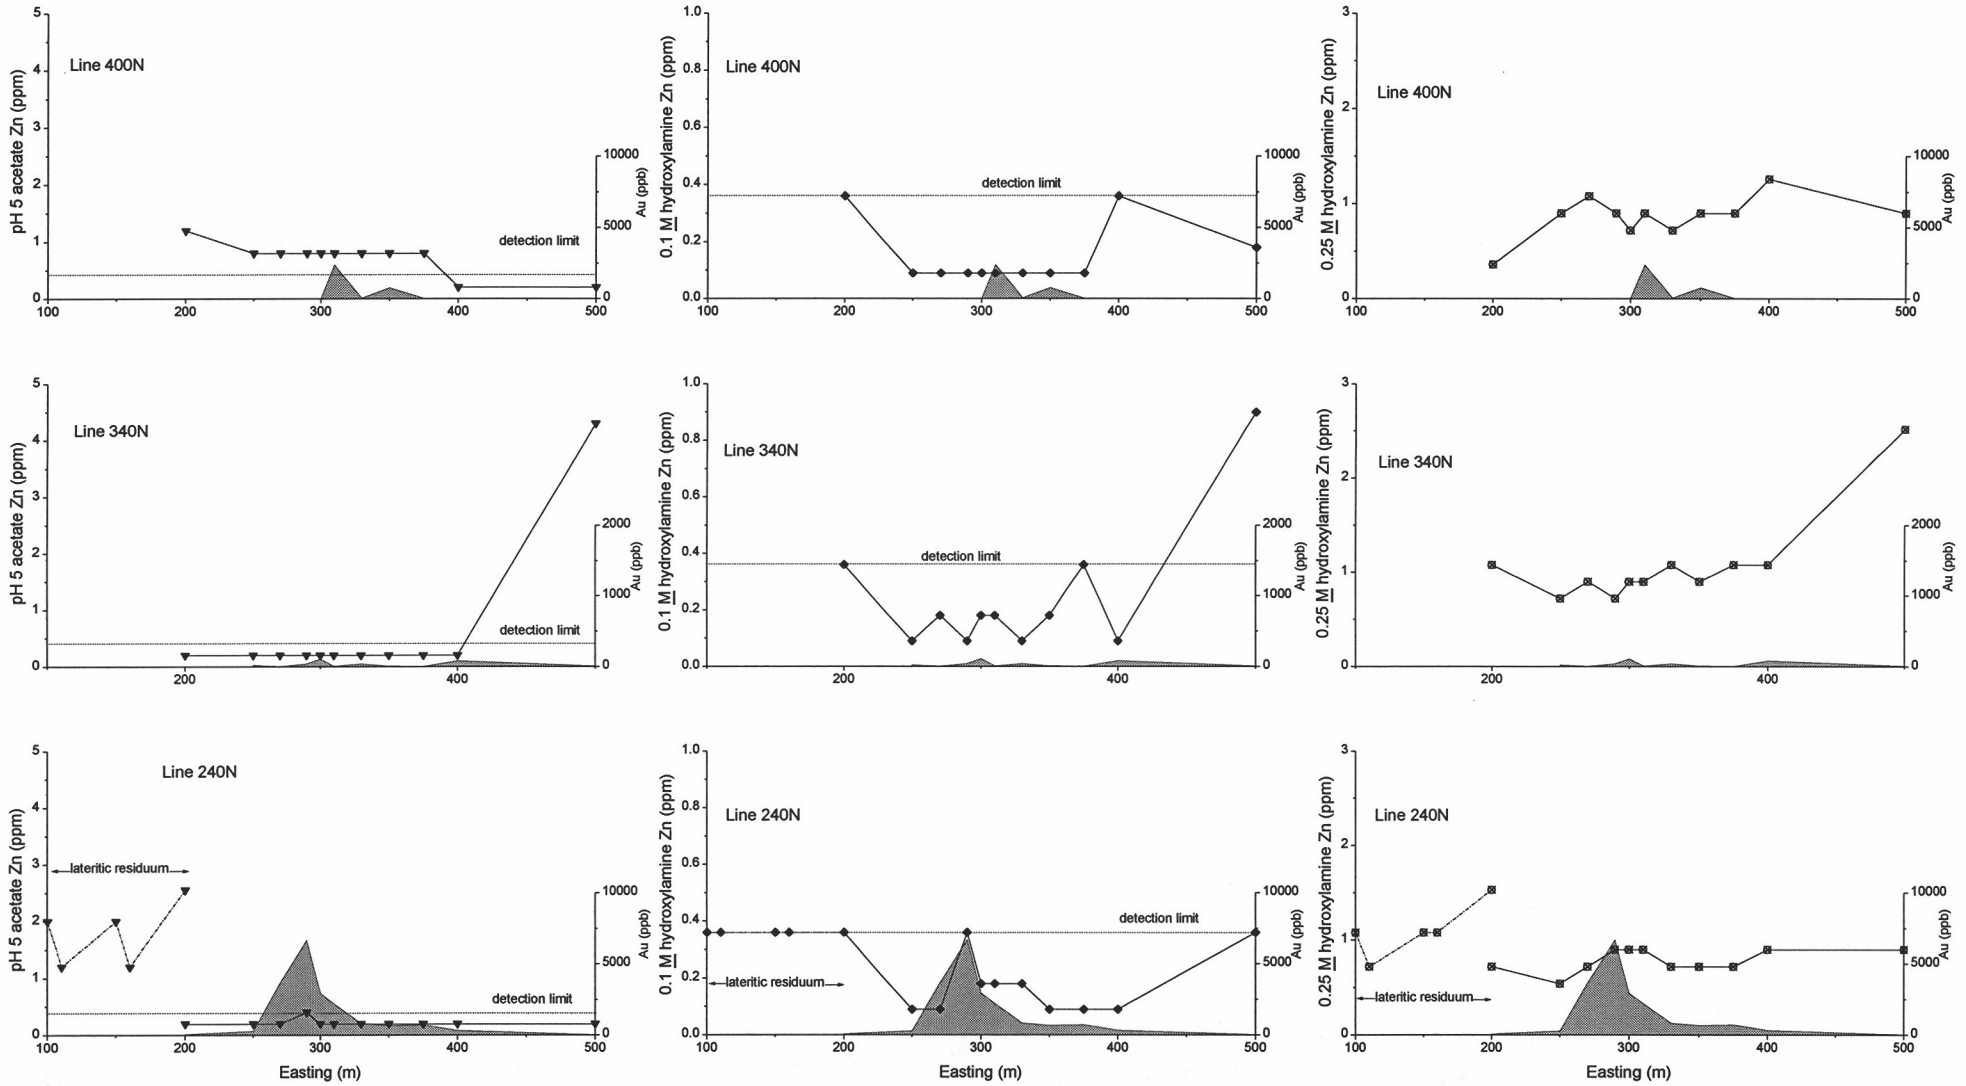

Figure A8.35: pH 5 acetate and hydroxylamine extractable Zn from Fender lines 400, 340 and 240 N.
(Shaded area represents highest determined Au content in top 8 m).

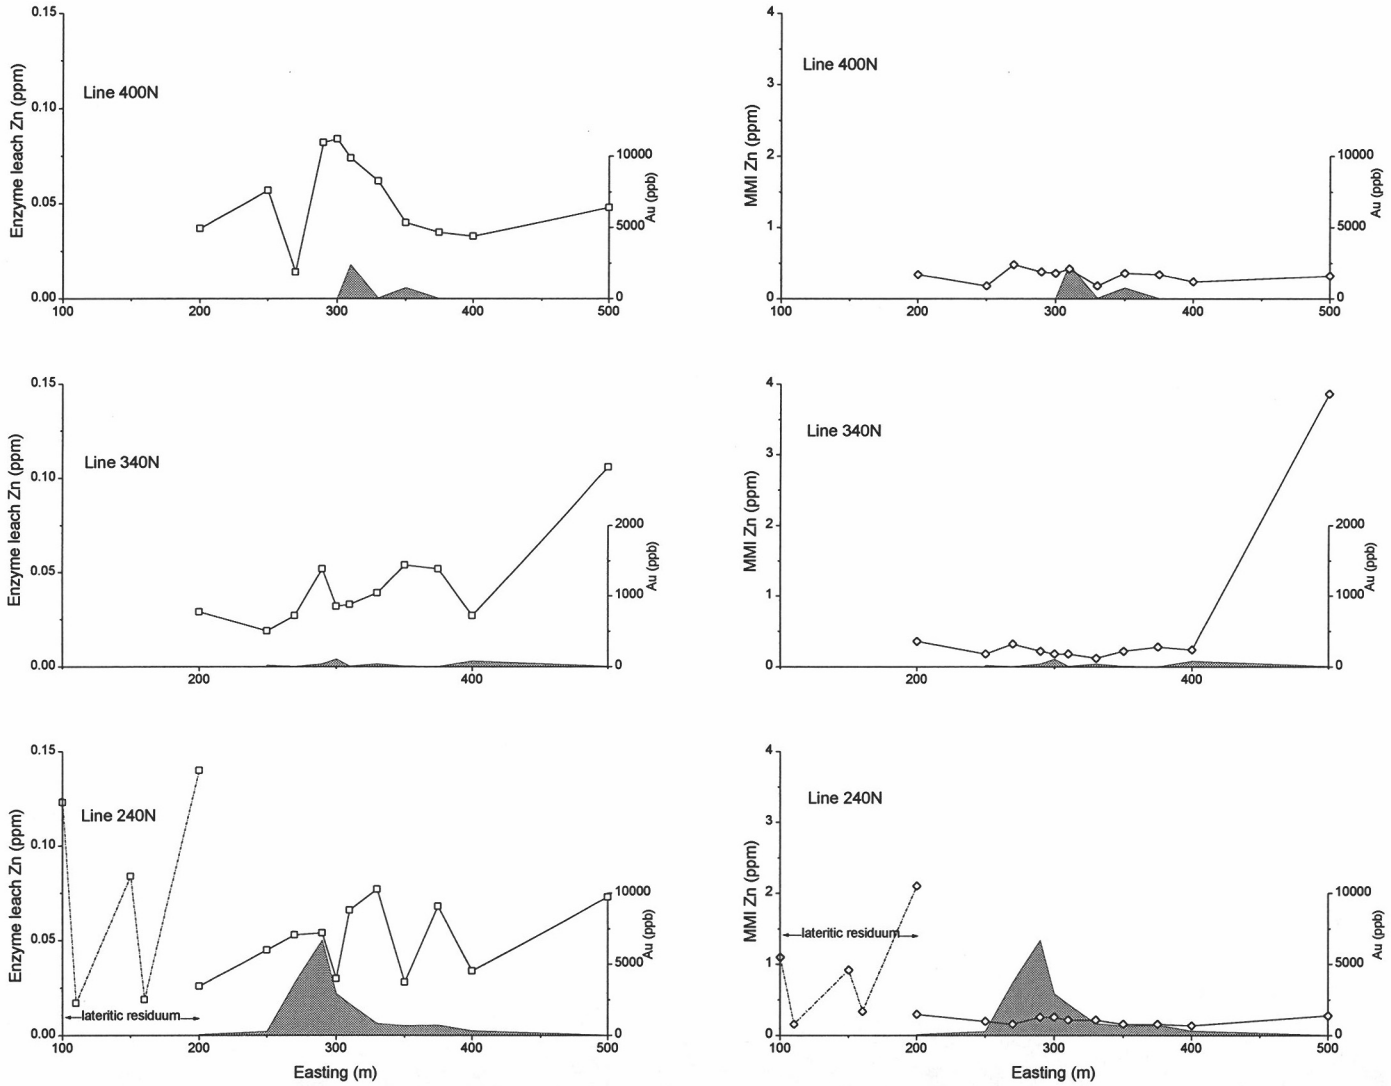

Figure A8.36: Enzyme leach and MMI Zn from Fender lines 400, 340 and 240 N.
(Shaded area represents highest determined Au content in top 8 m).

Appendix 9: Traverse Data for Bronzewing

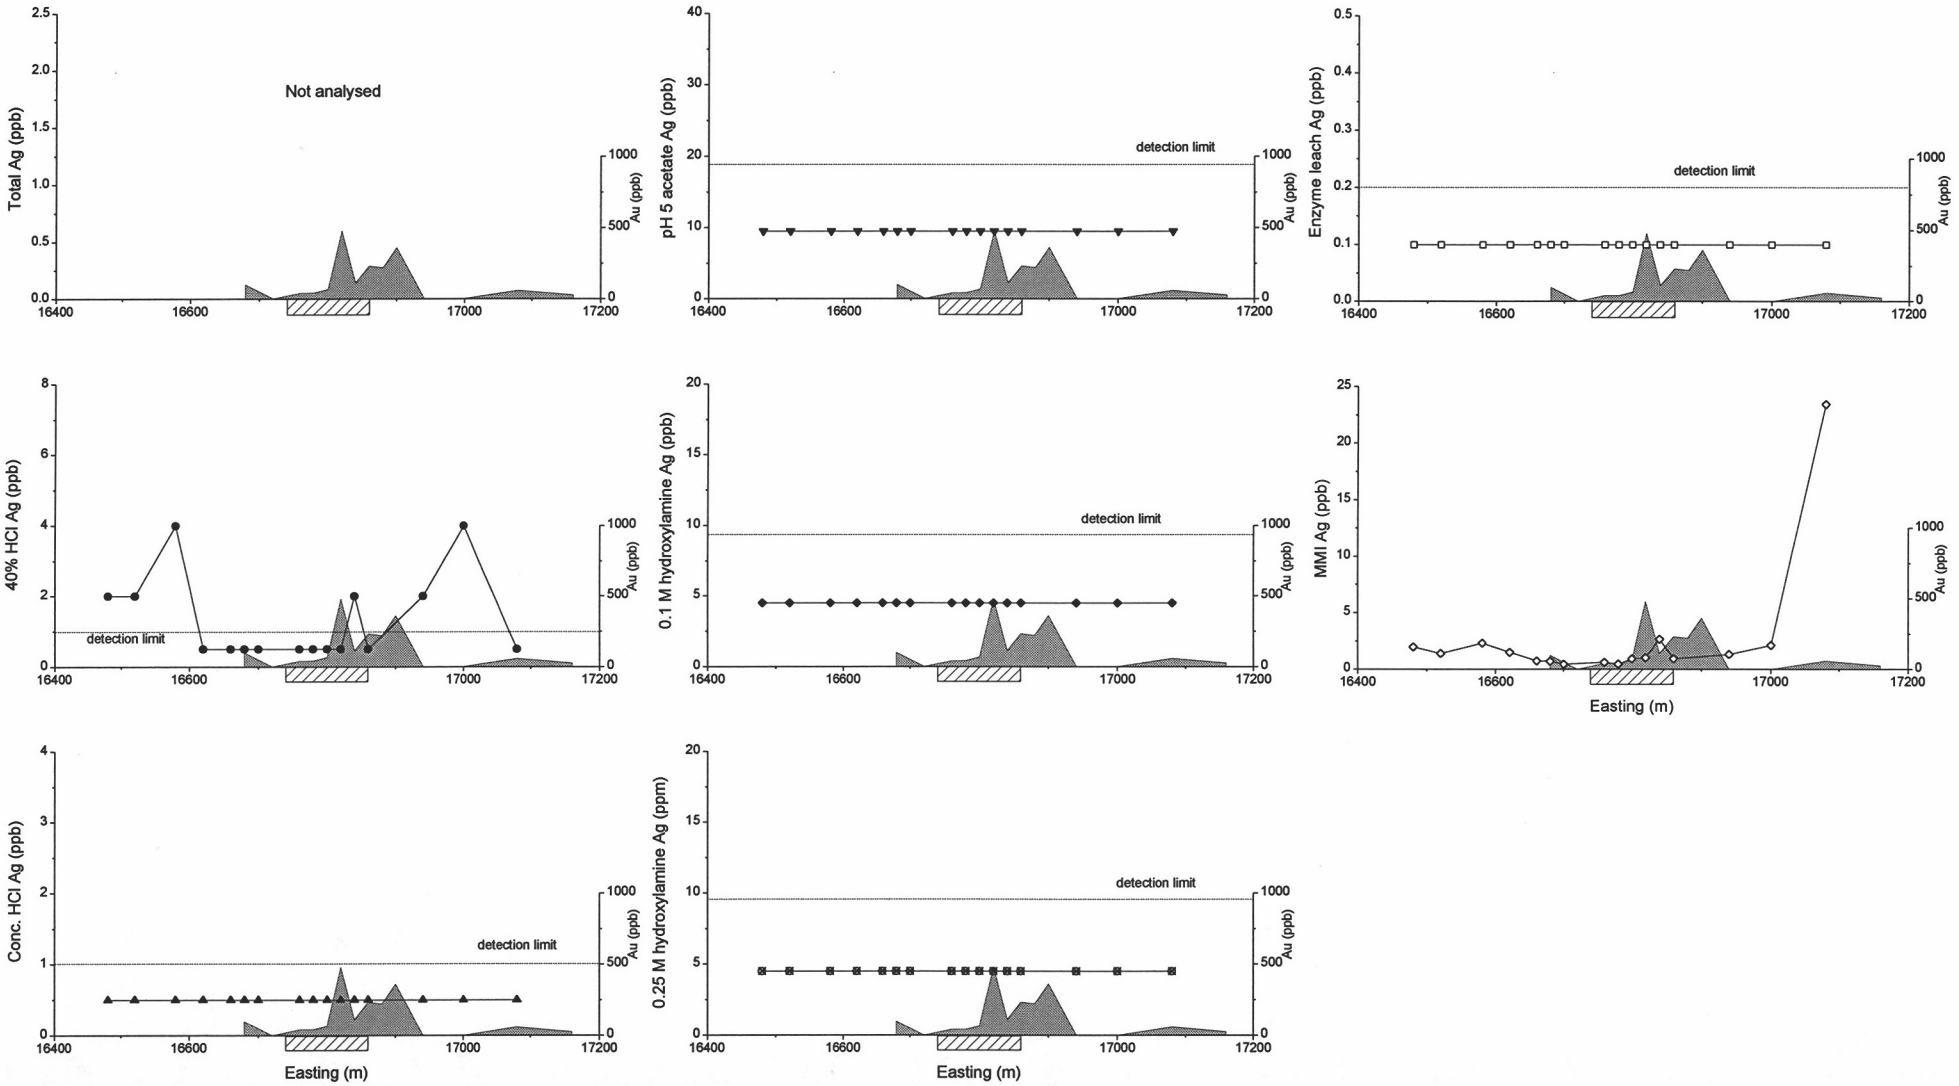

Figure A9.1: Total and extractable Ag from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

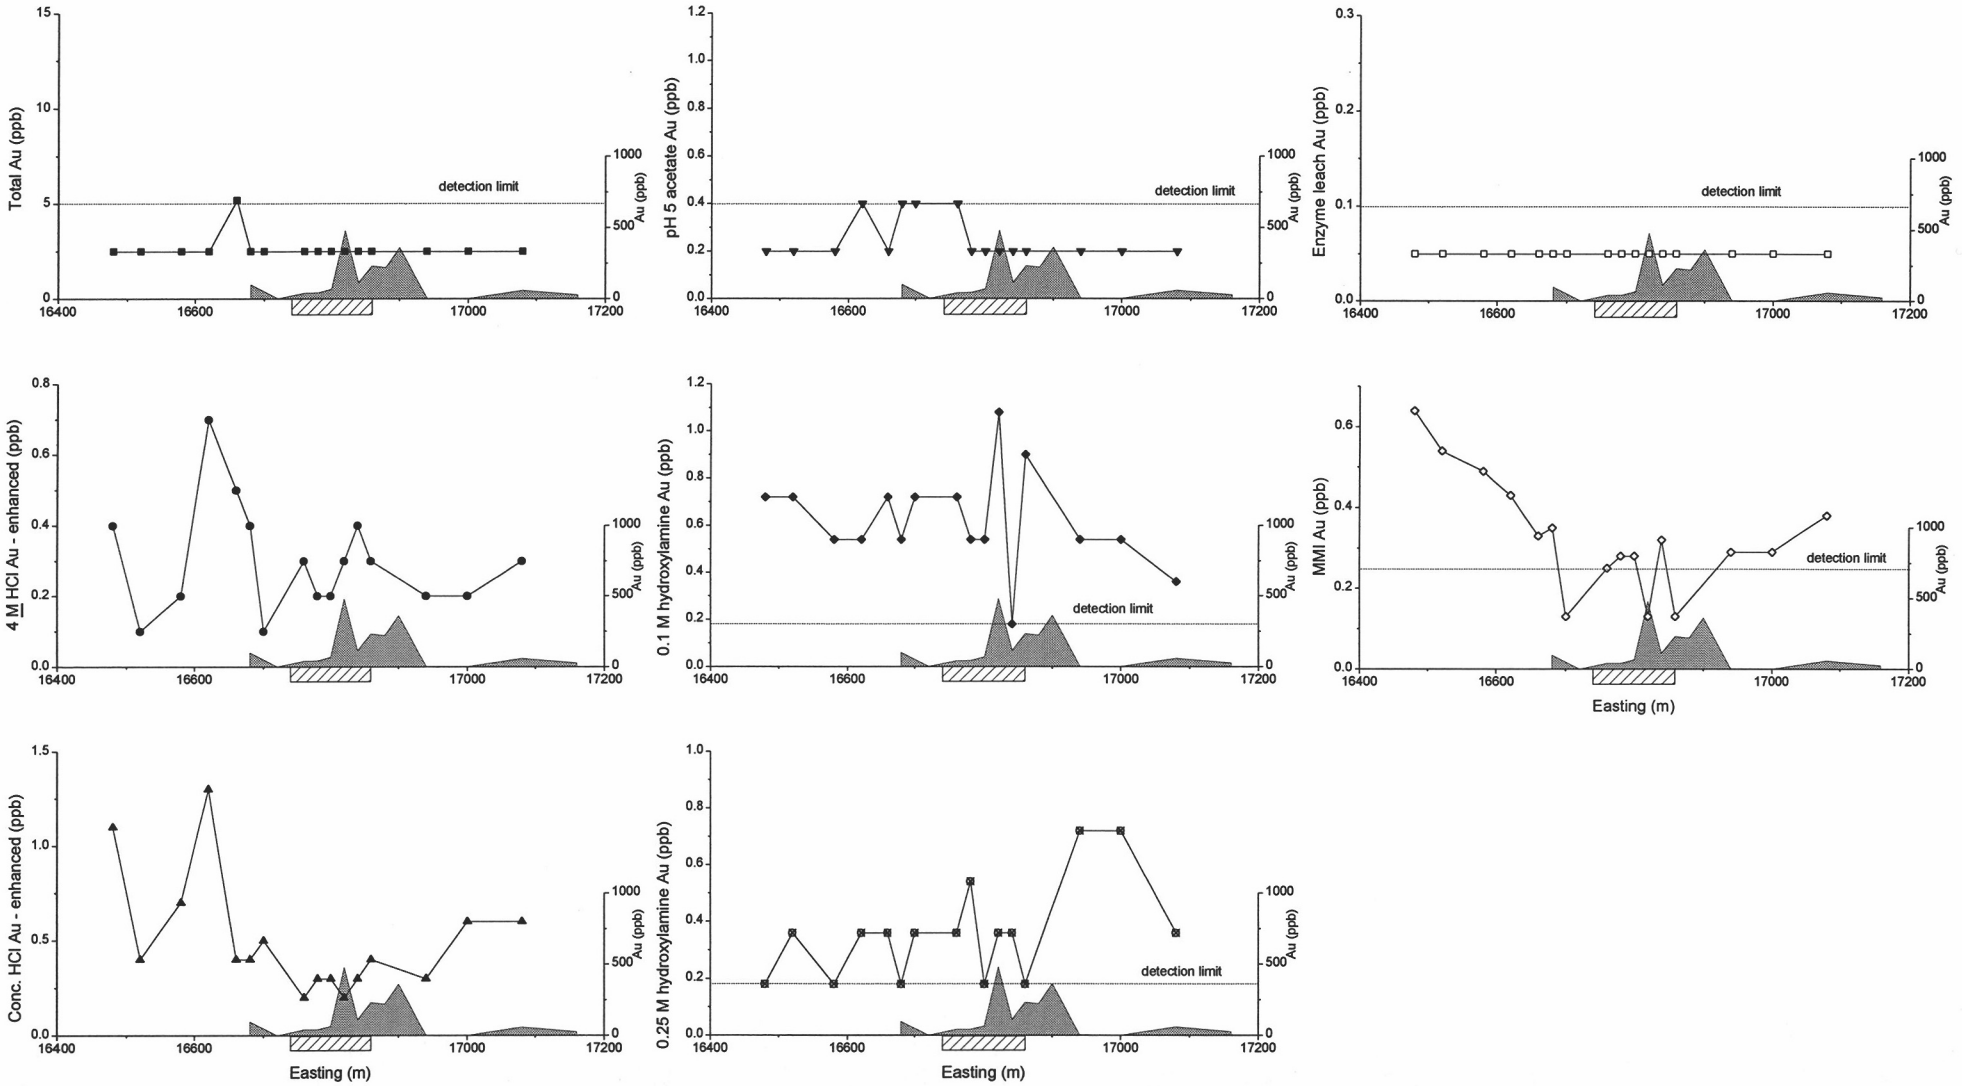

Figure A9.2: Total and extractable Au from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

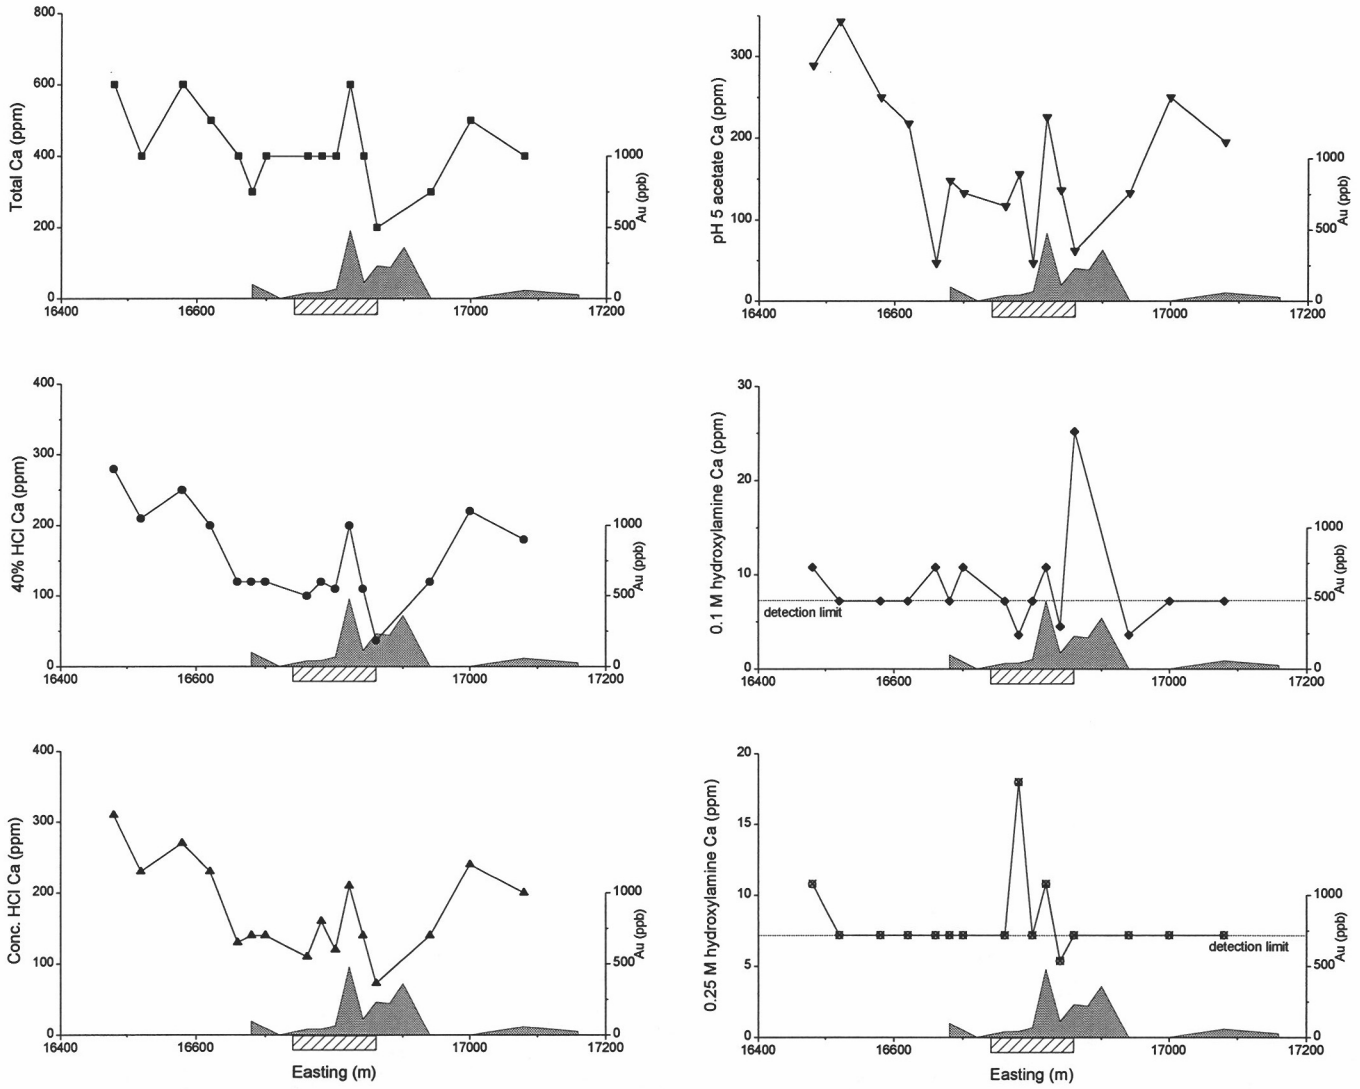

Figure A9.3: Total and extractable Ca from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

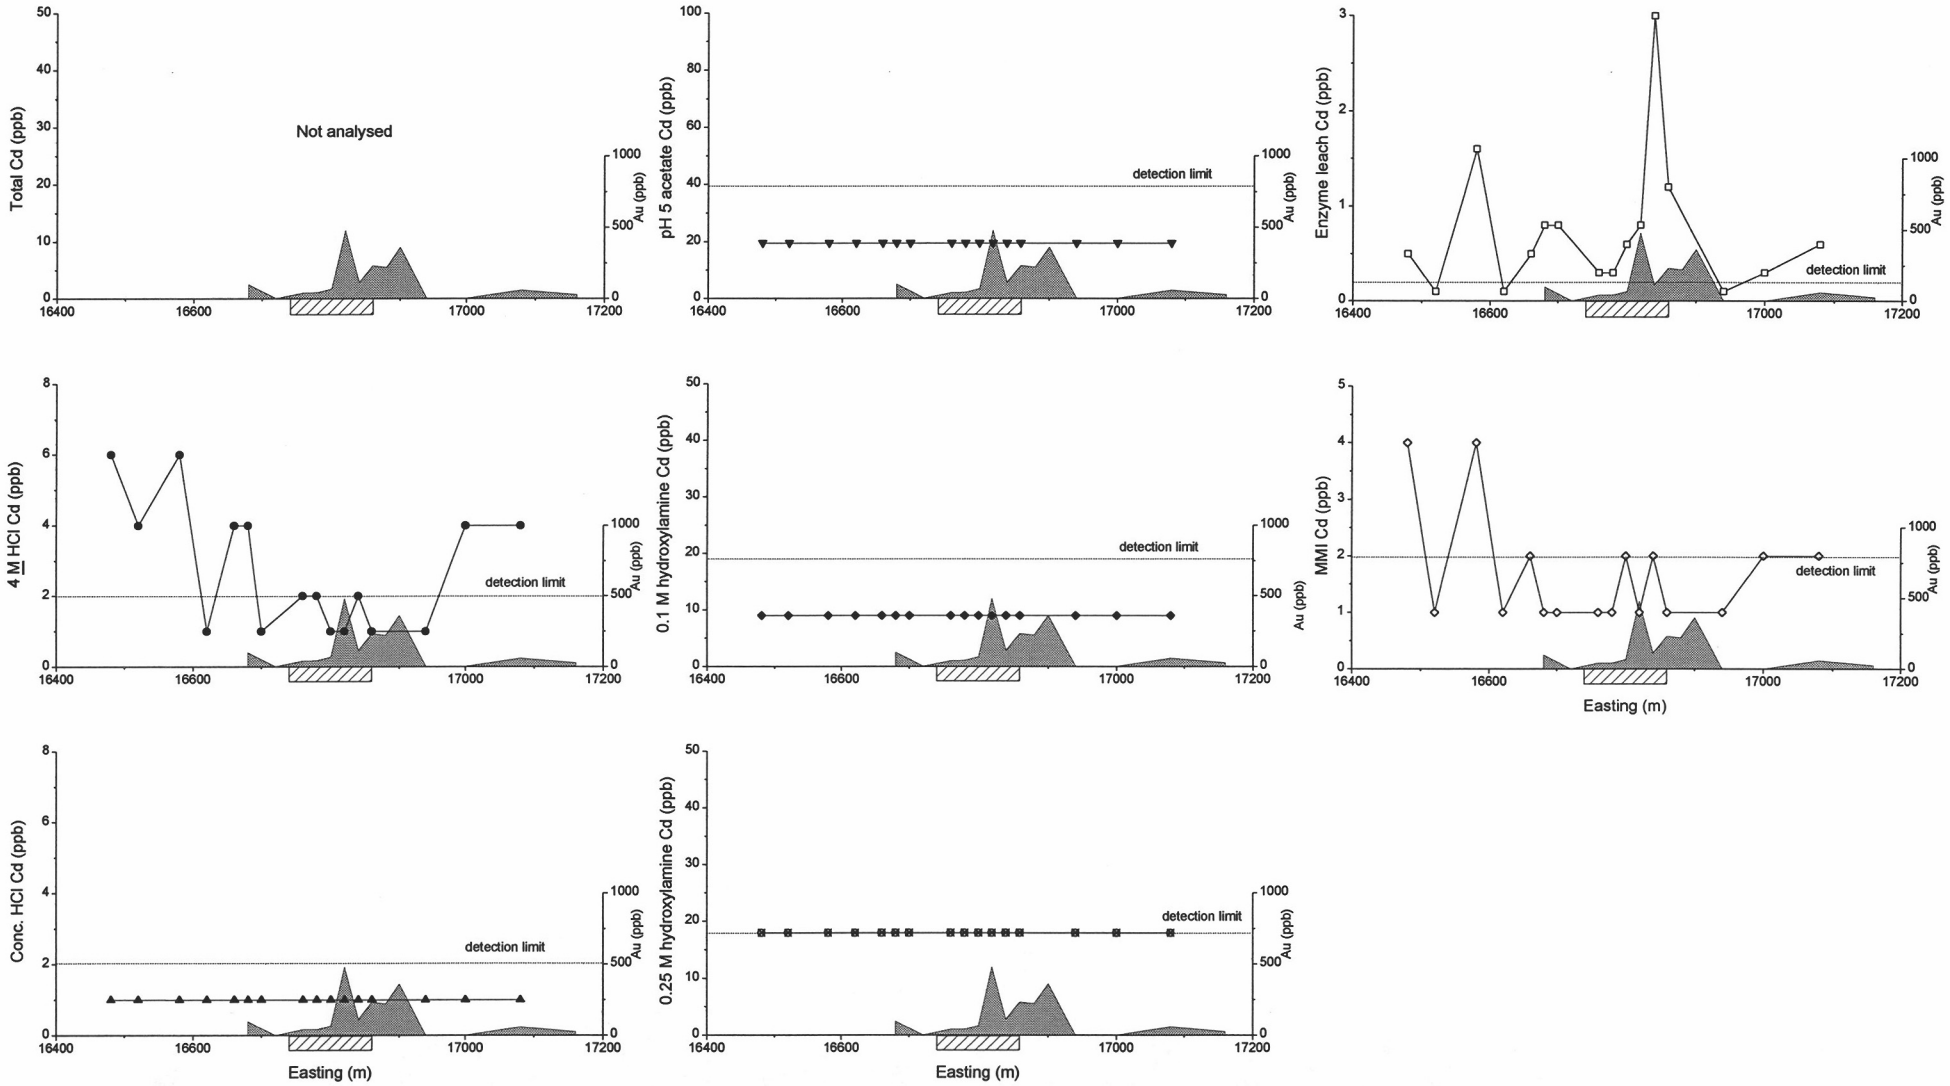

Figure A9.4: Total and extractable Cd from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

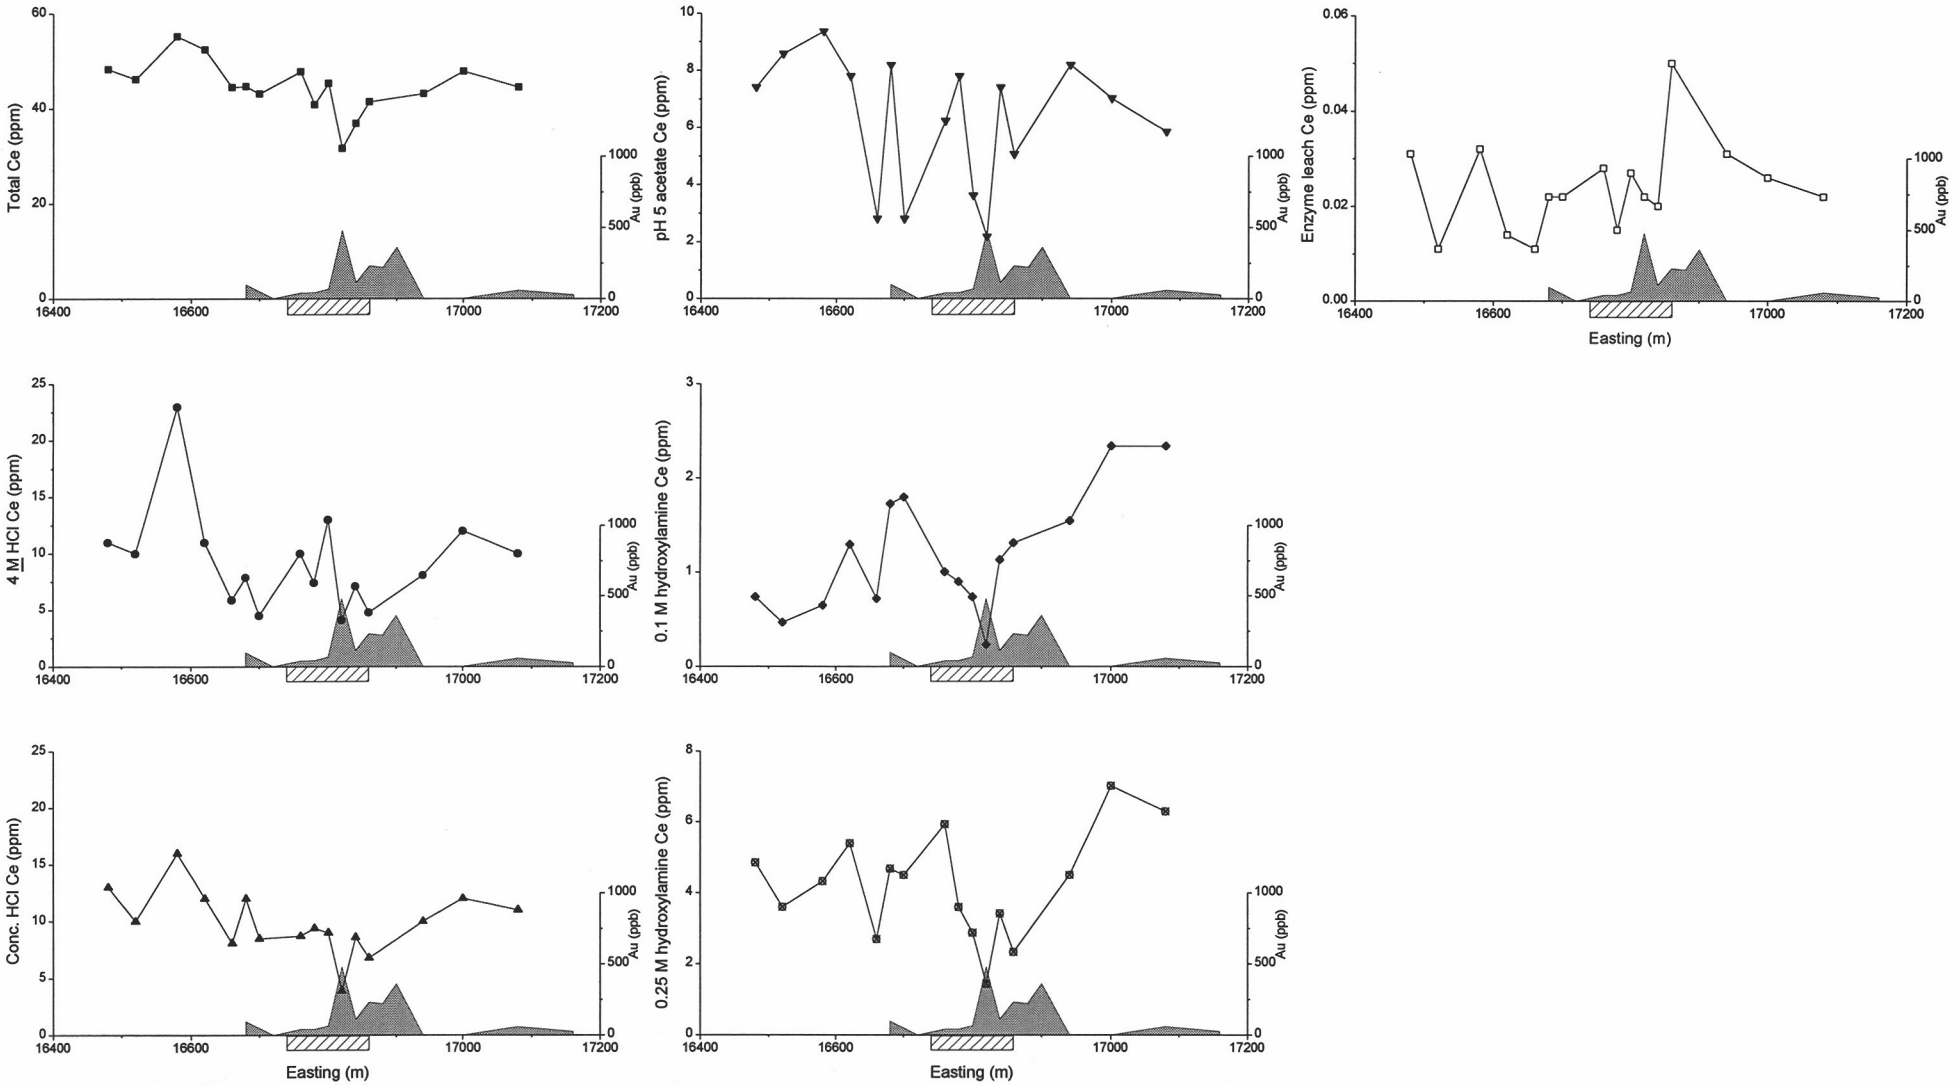

Figure A9.5: Total and extractable Ce from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

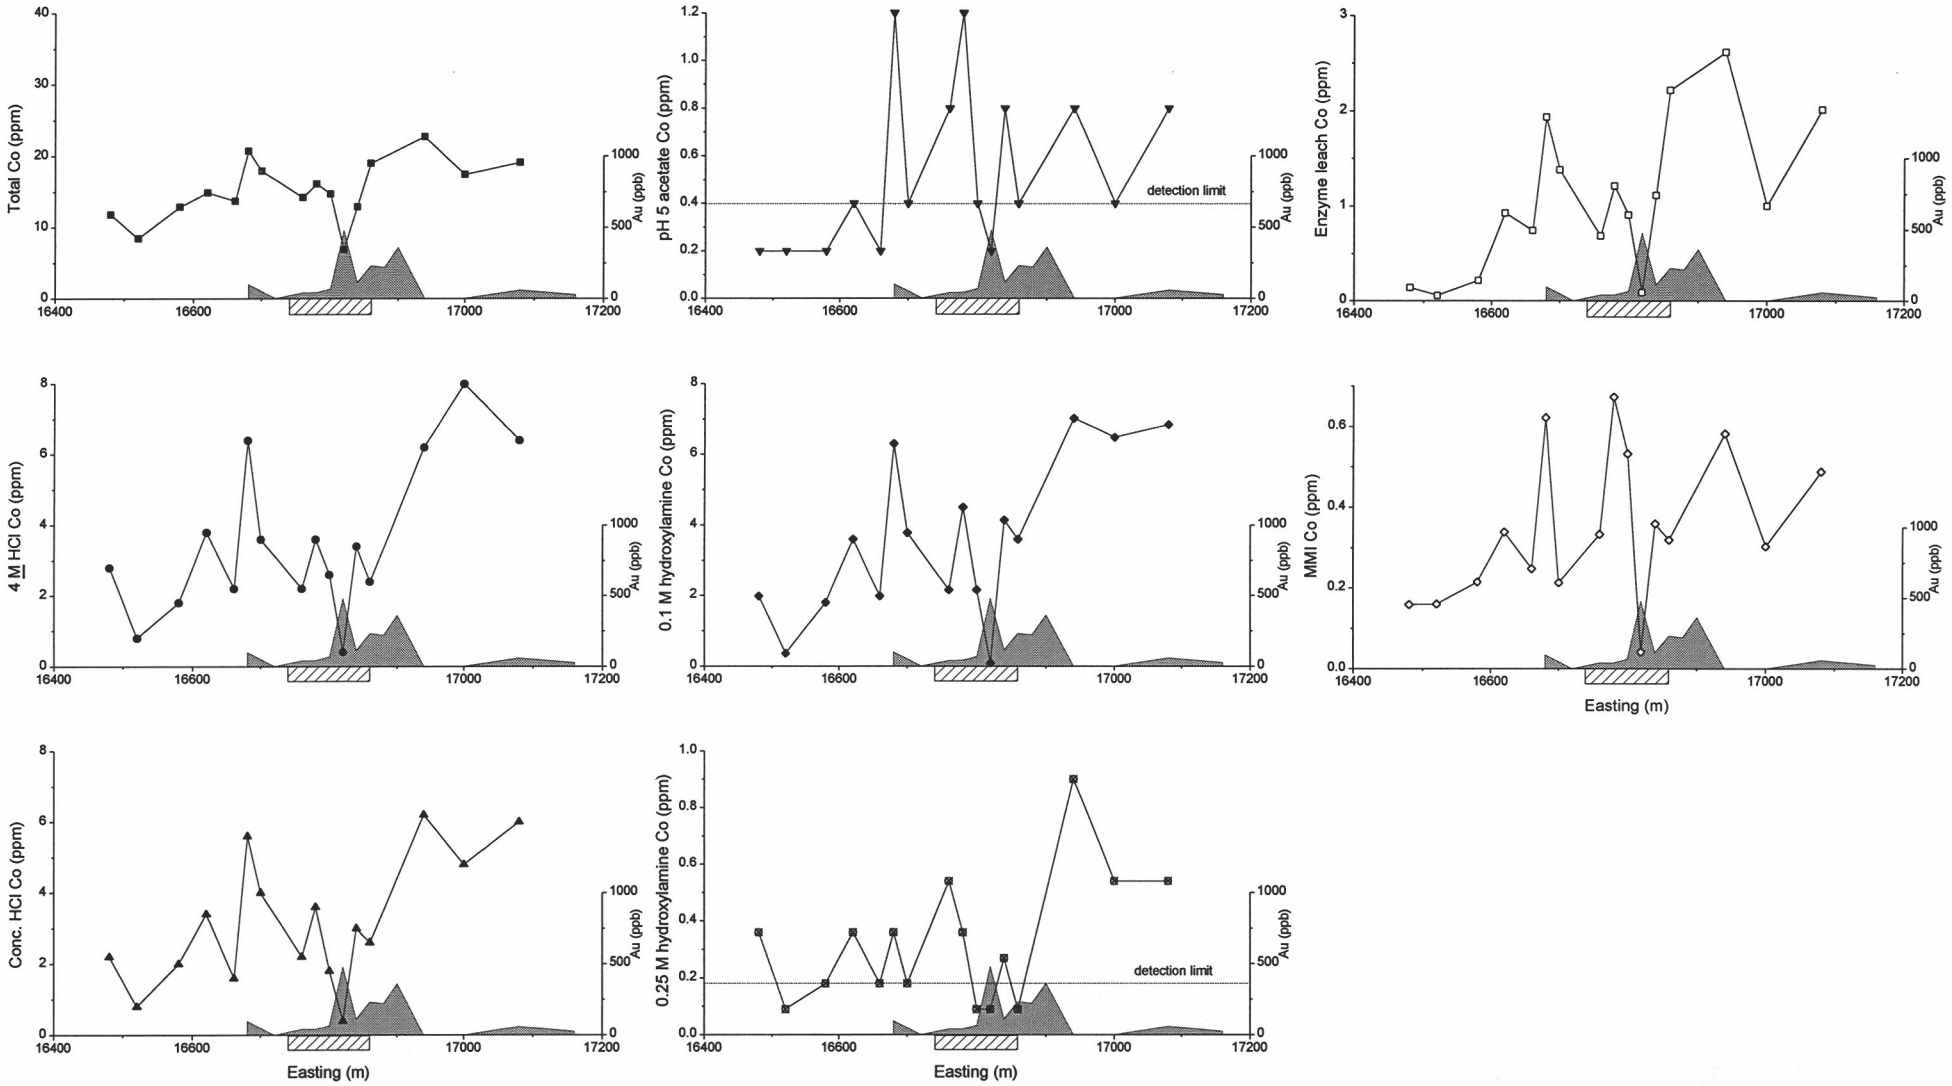

Figure A9.6: Total and extractable Co from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

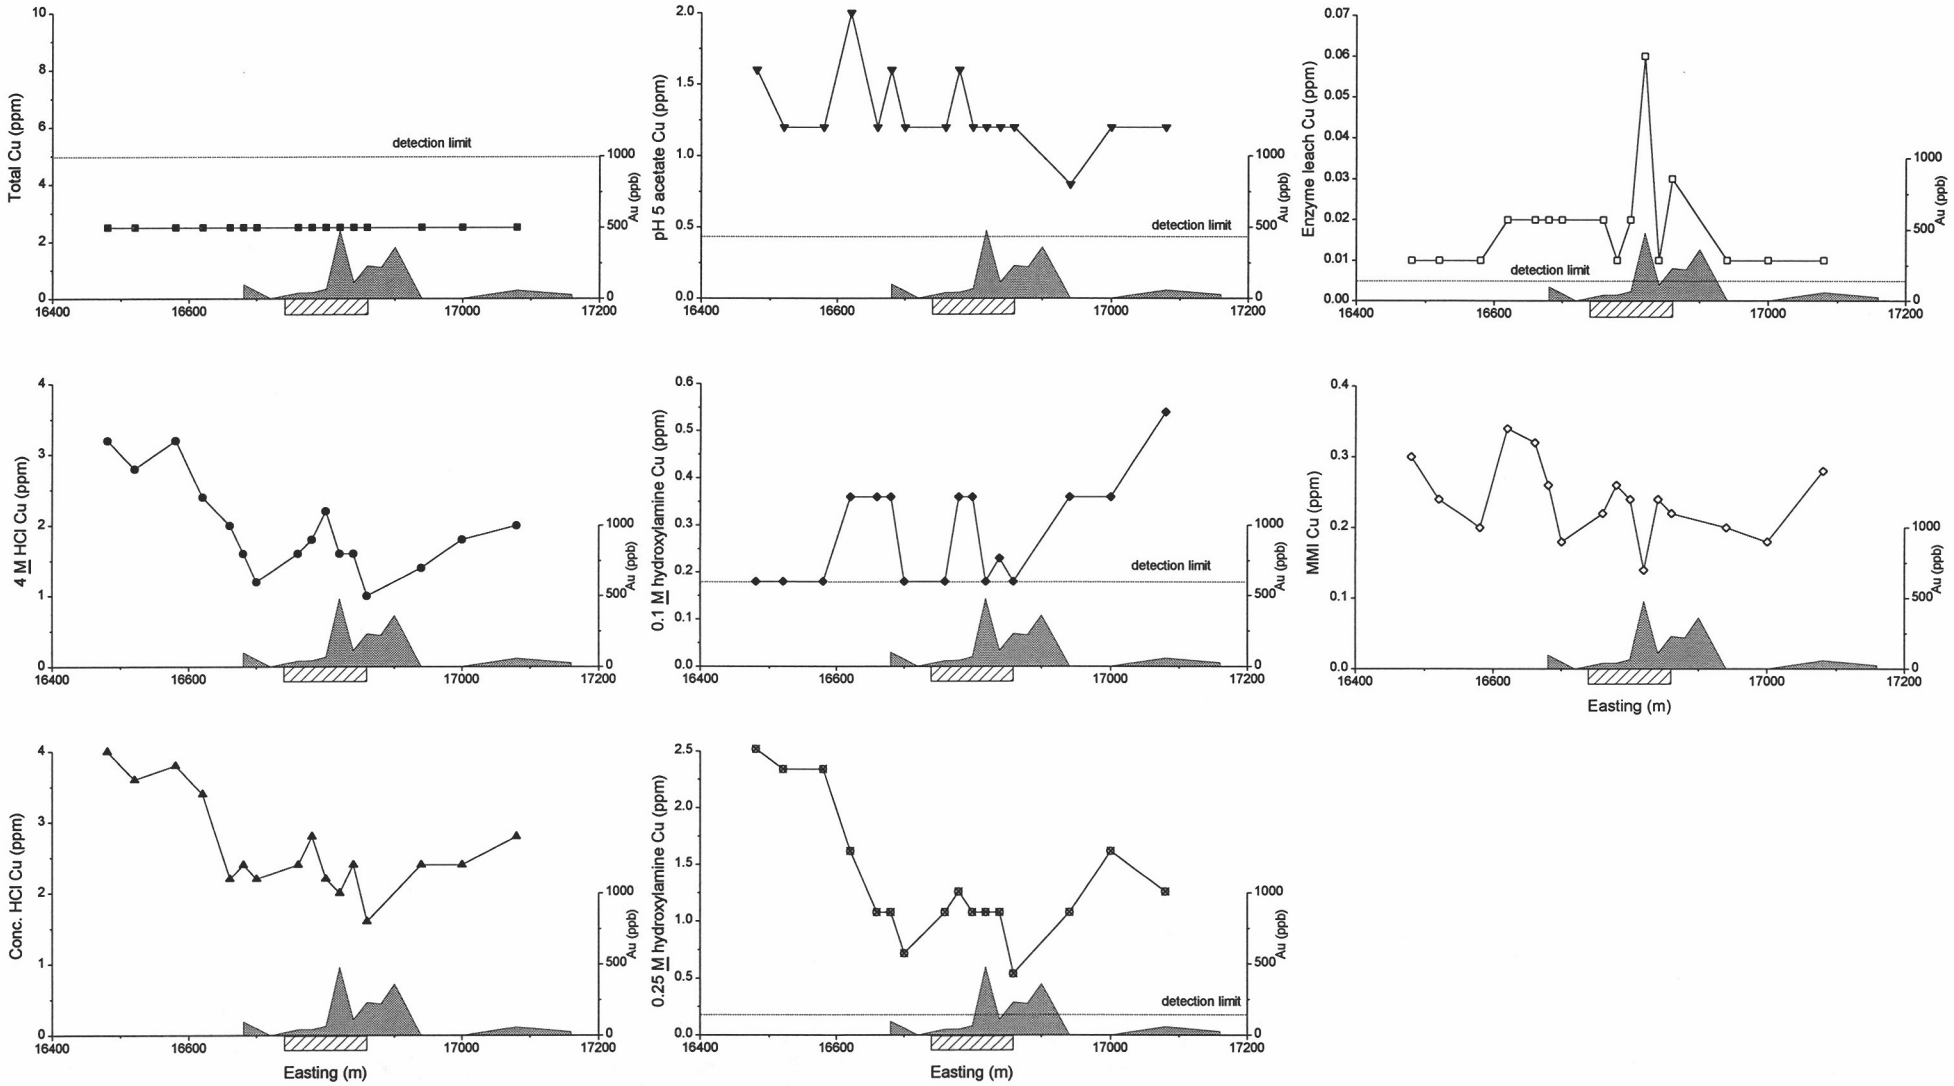

Figure A9.7: Total and extractable Cu from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

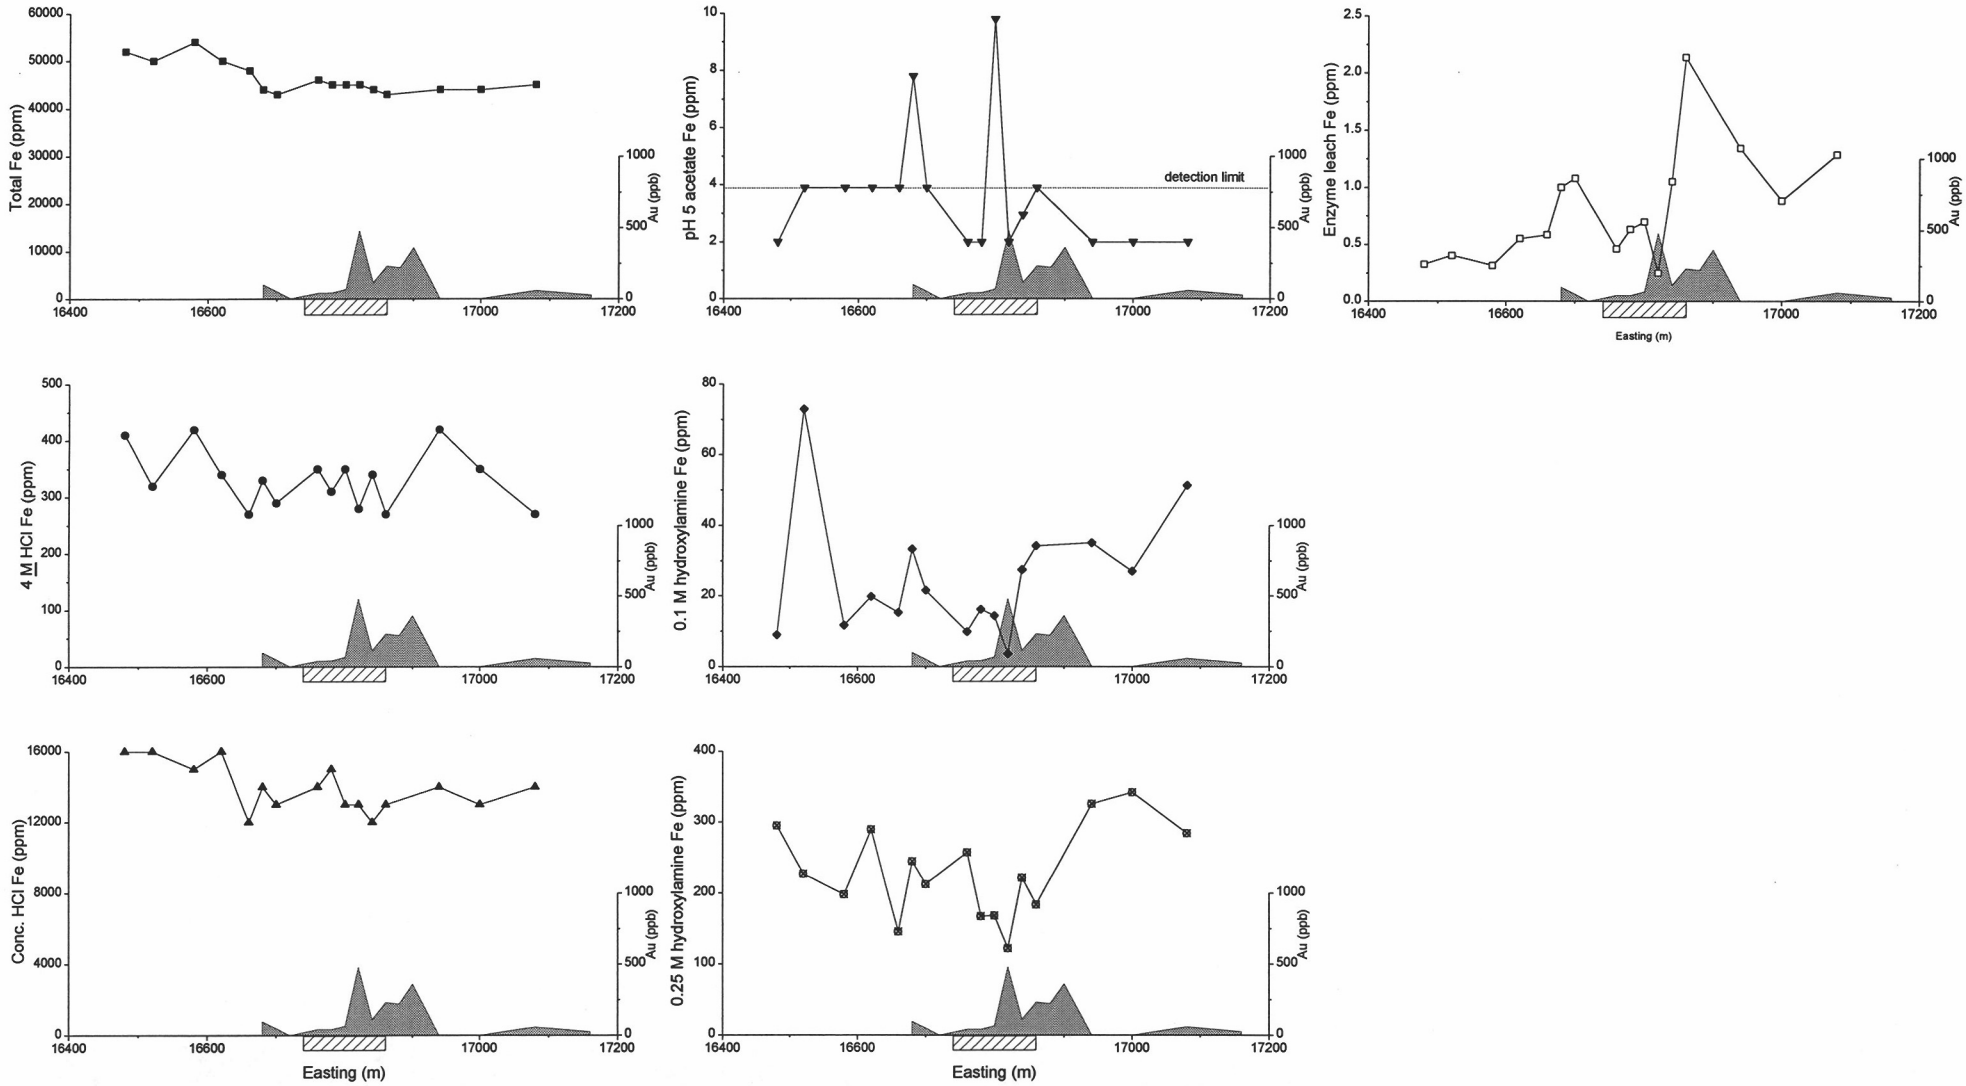

Figure A9.8: Total and extractable Fe from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

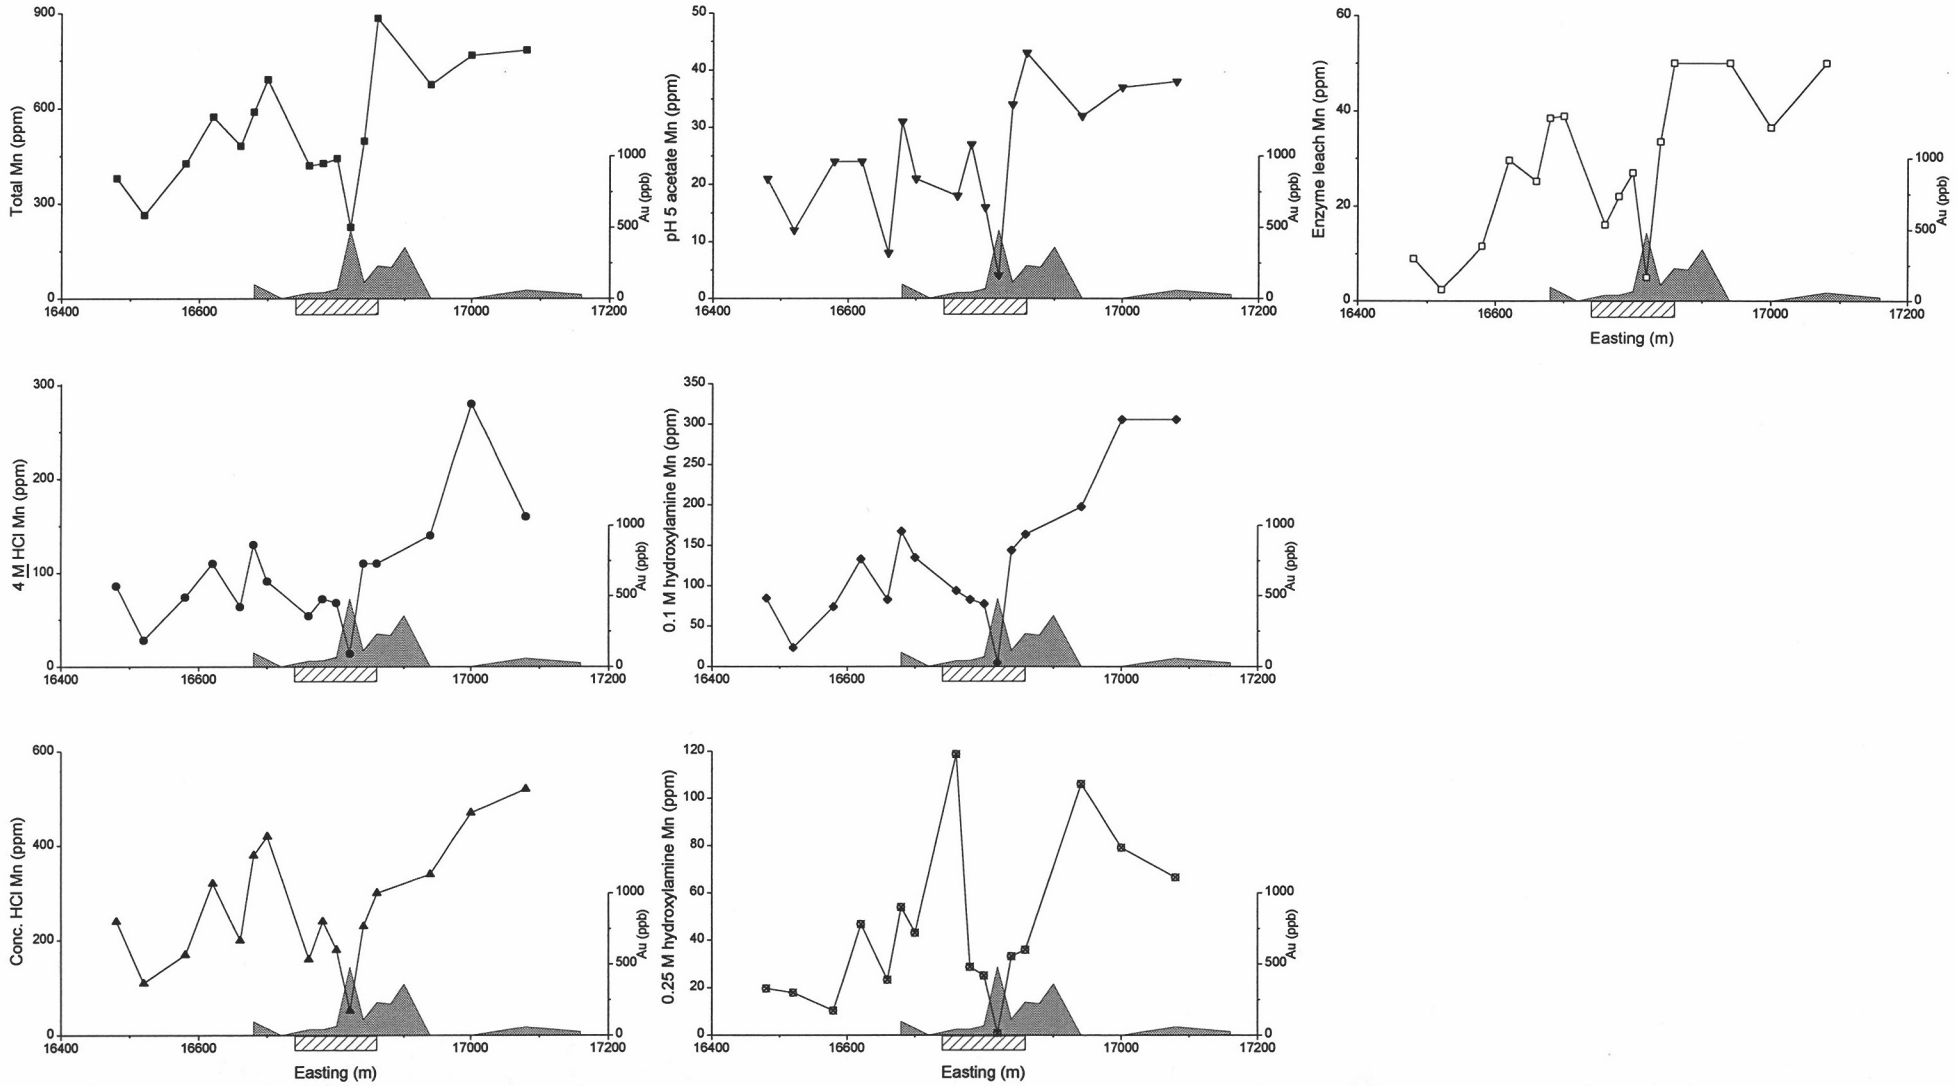

Figure A9.9: Total and extractable Mn from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

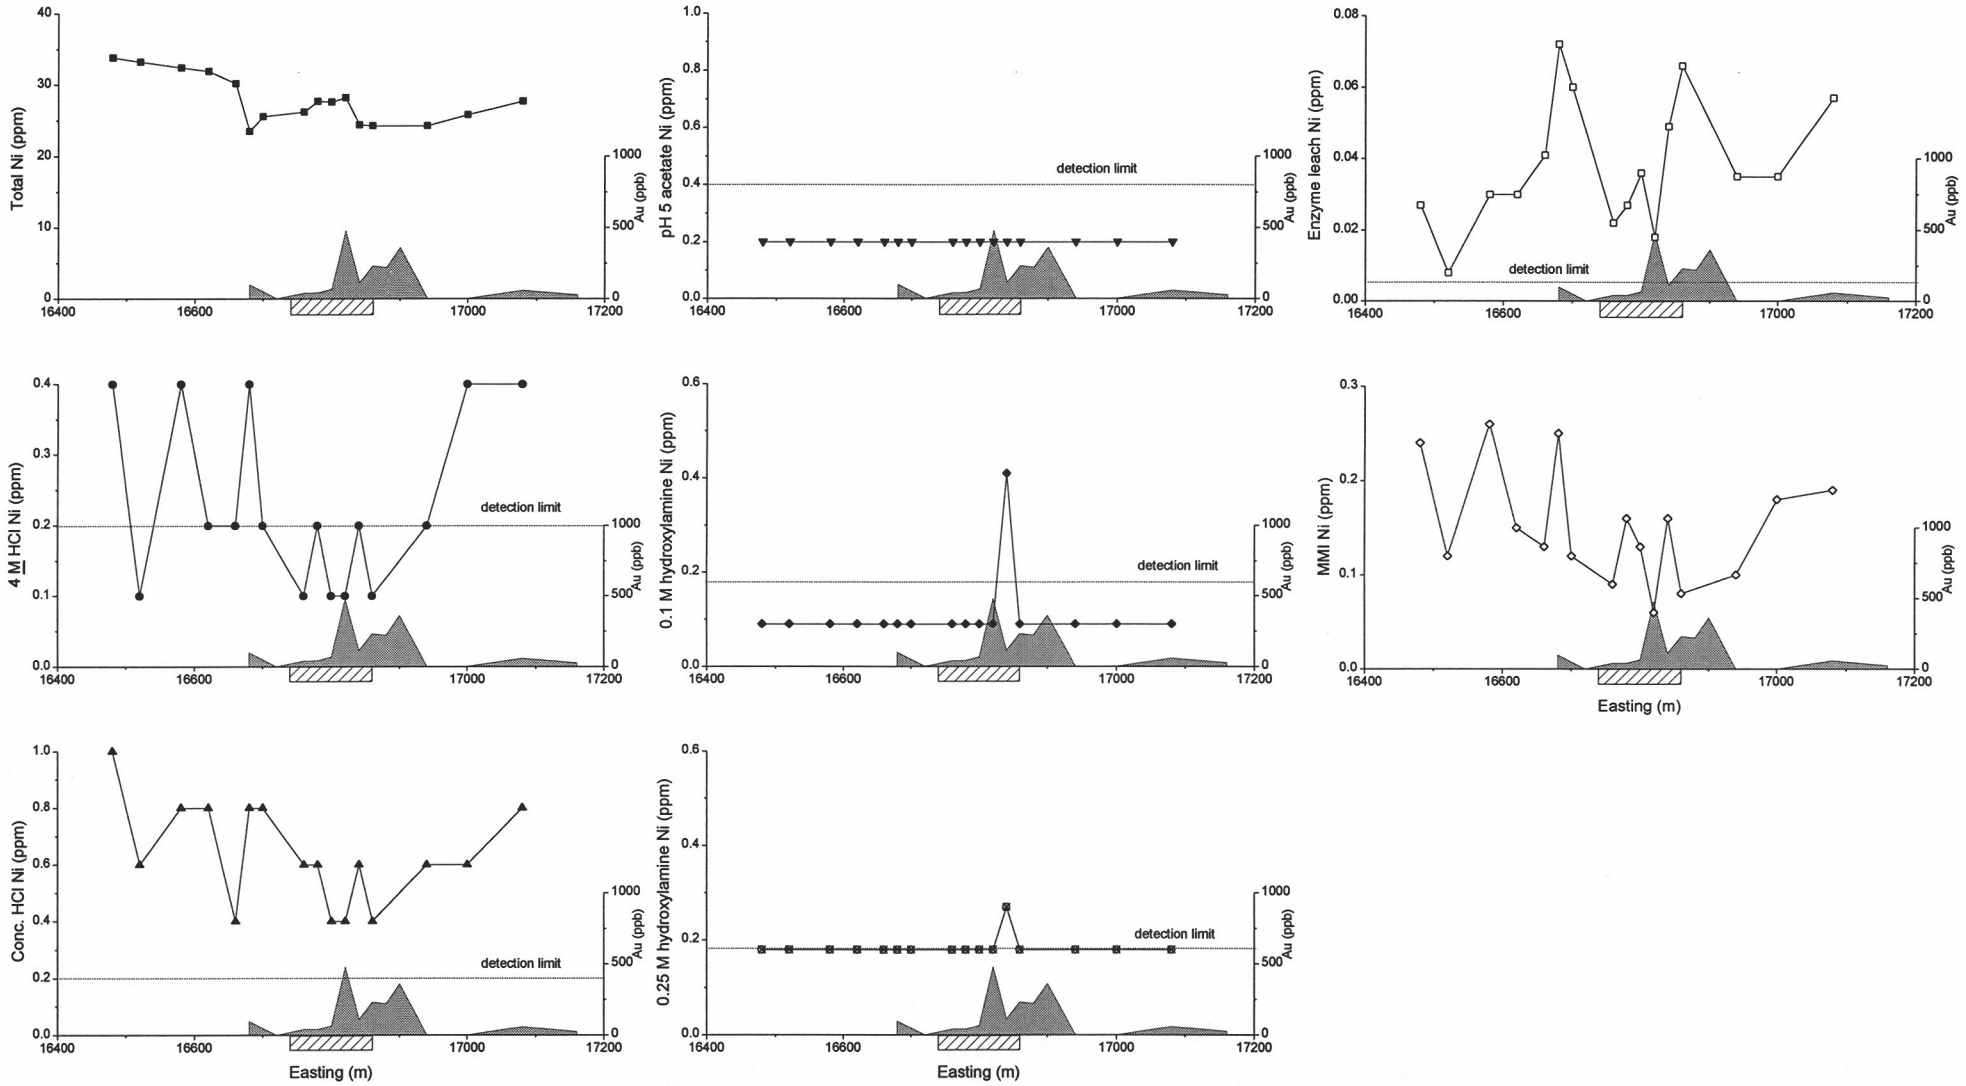

Figure A9.10: Total and extractable Ni from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

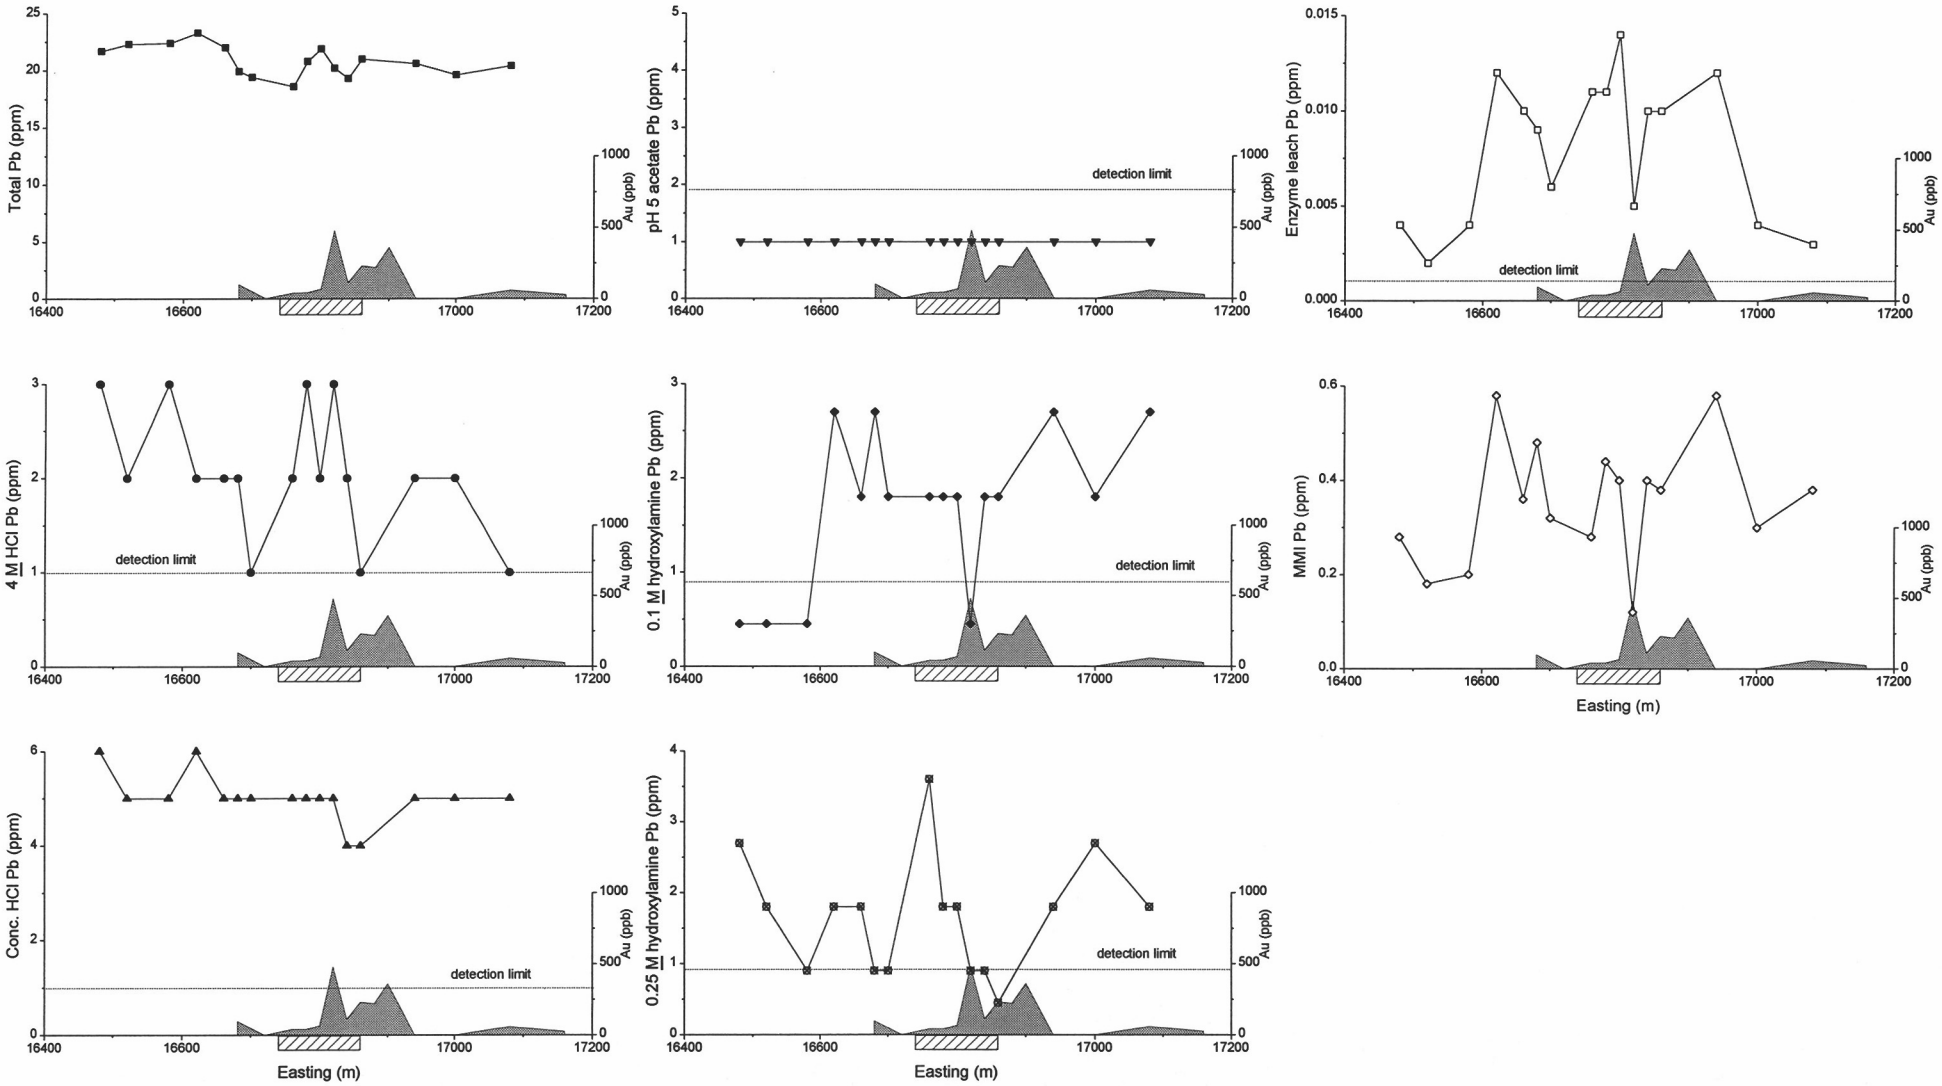

Figure A9.11: Total and extractable Pb from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

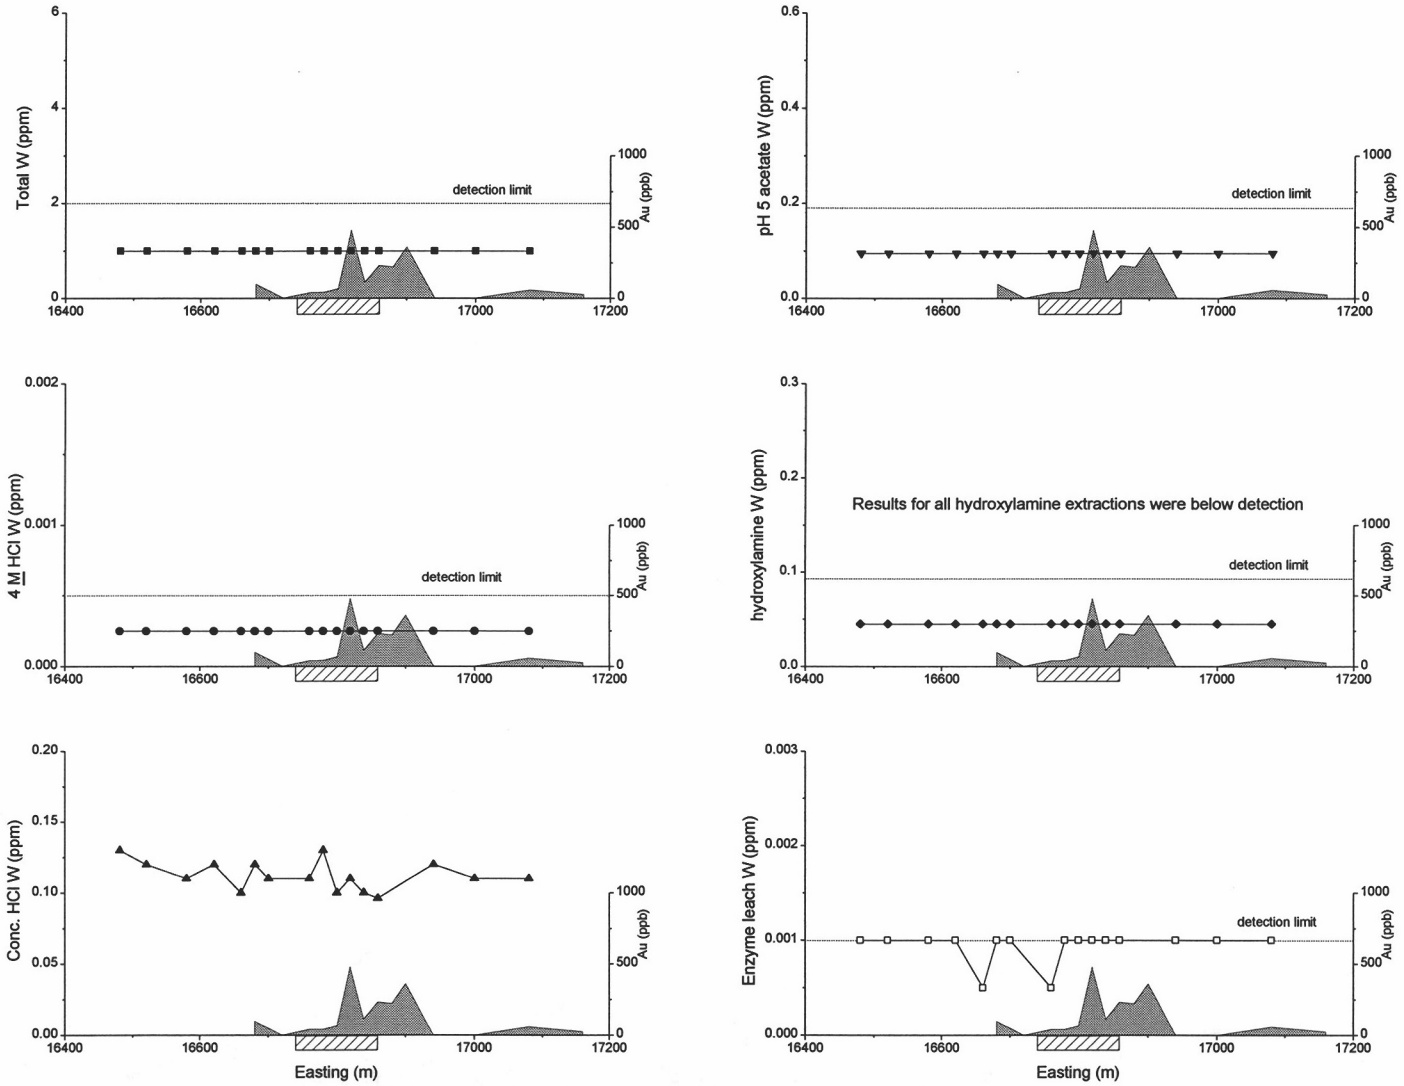

Figure A9.12: Total and extractable W from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

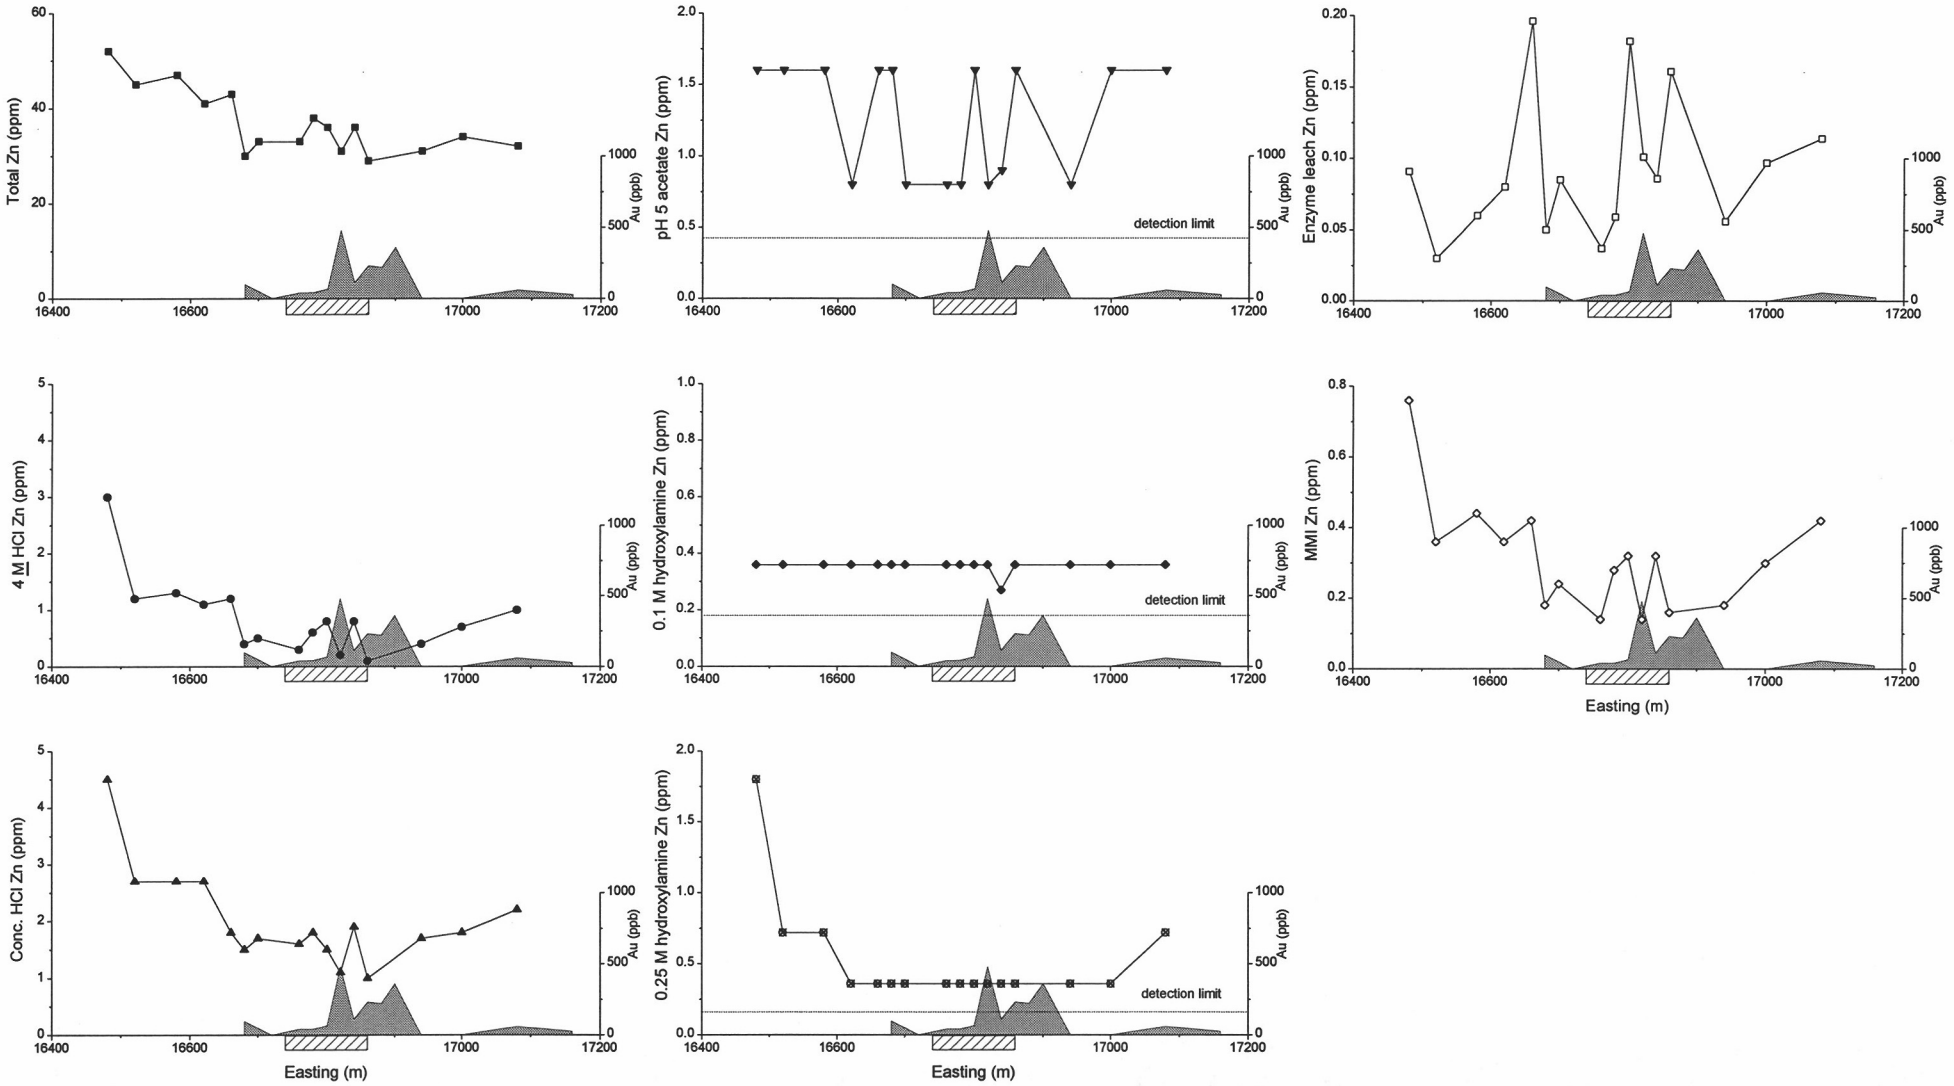

Figure A9.13: Total and extractable Zn from Bronzewing line 9800N.
(Shaded area is lateritic Au concentration and hatched area position of mineralization at 100 m).

Appendix 10: Traverse Data for Curara

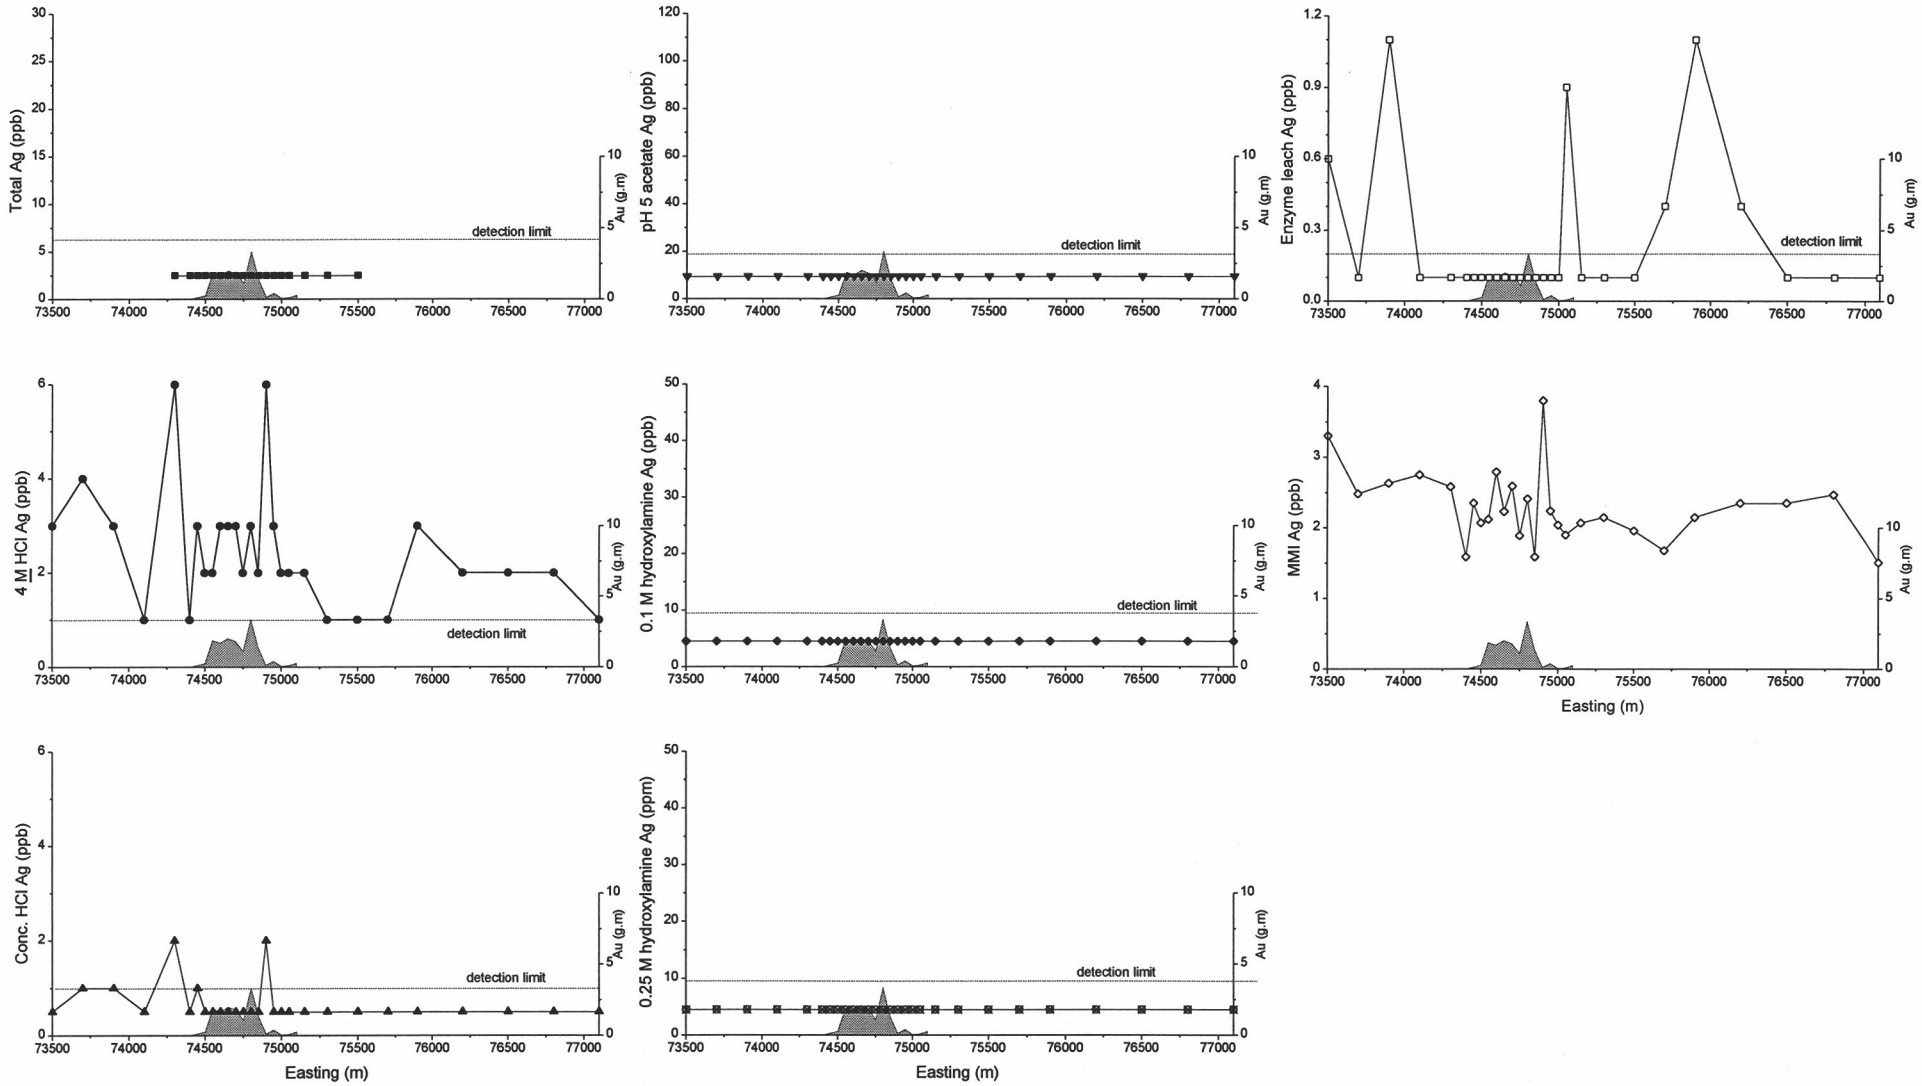

Figure A10.1: Total and extractable Ag from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

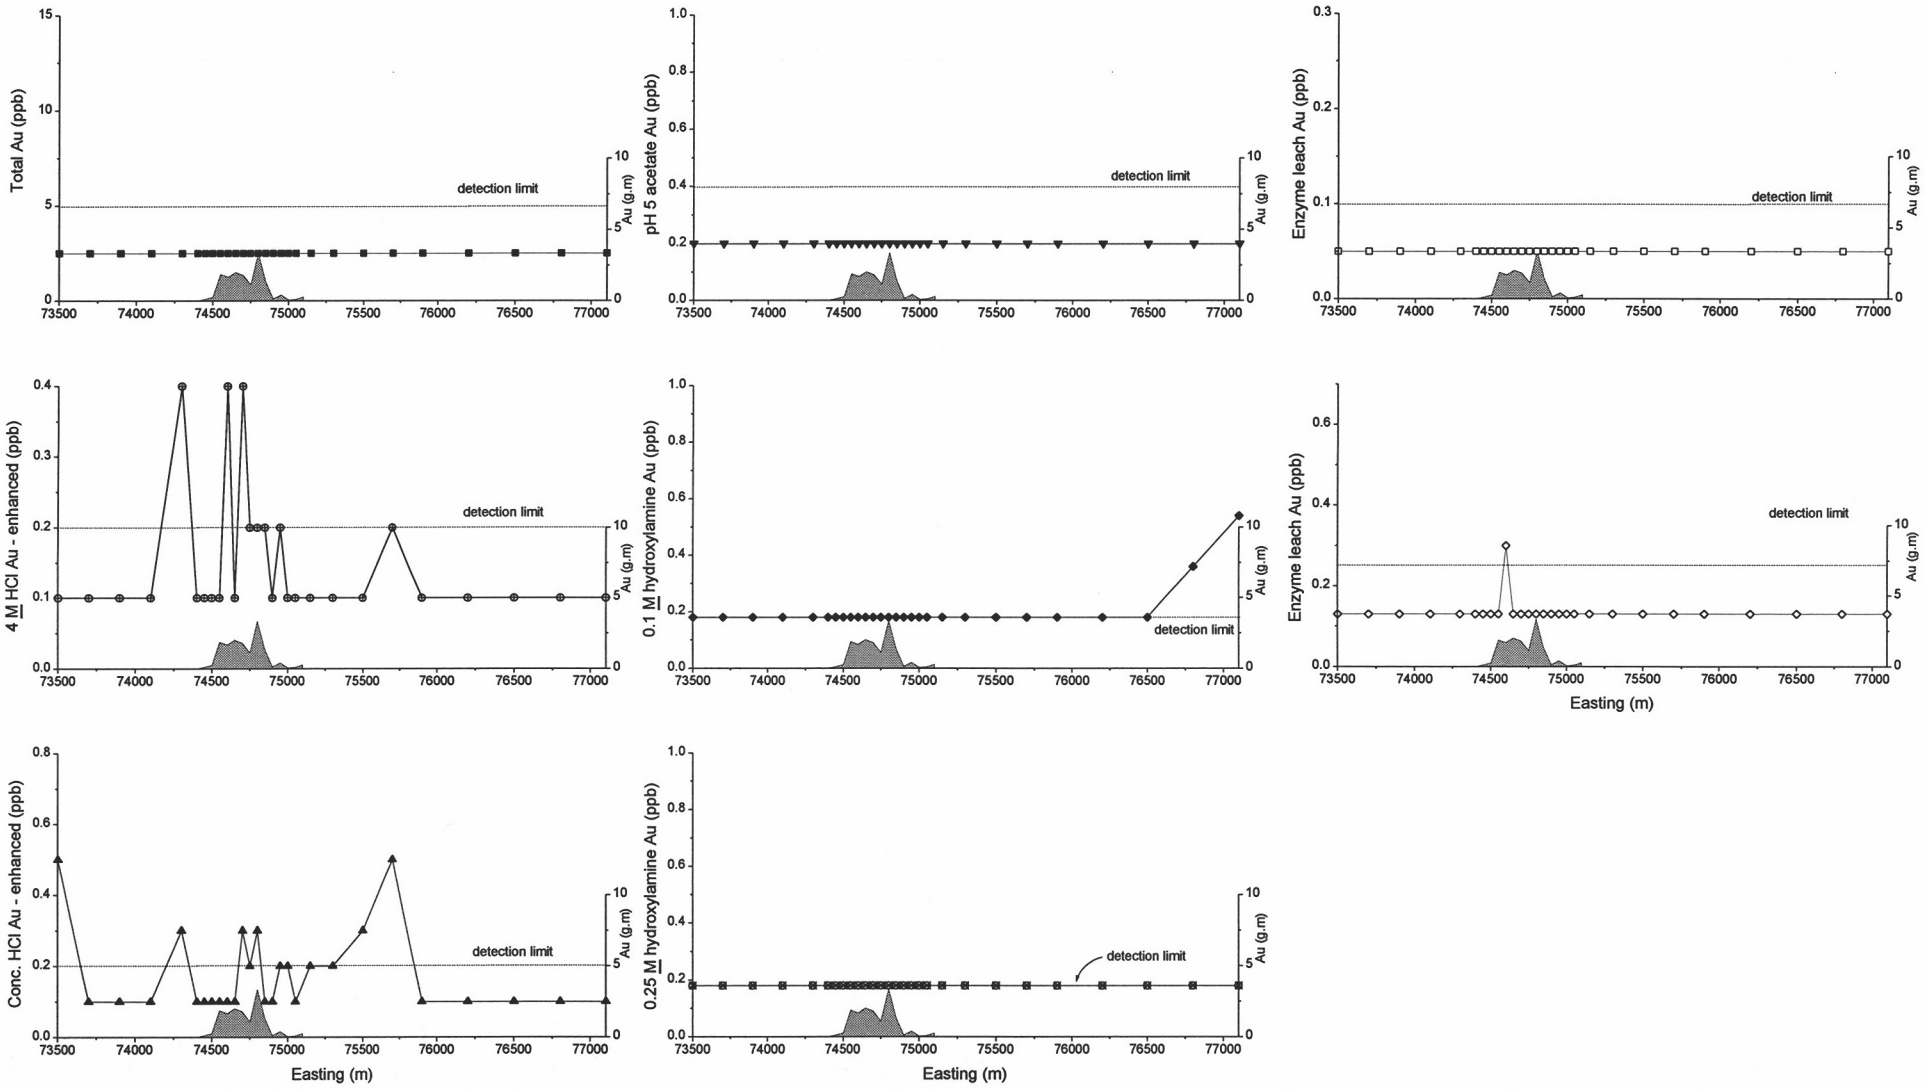

Figure A10.2: Total and extractable Au from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

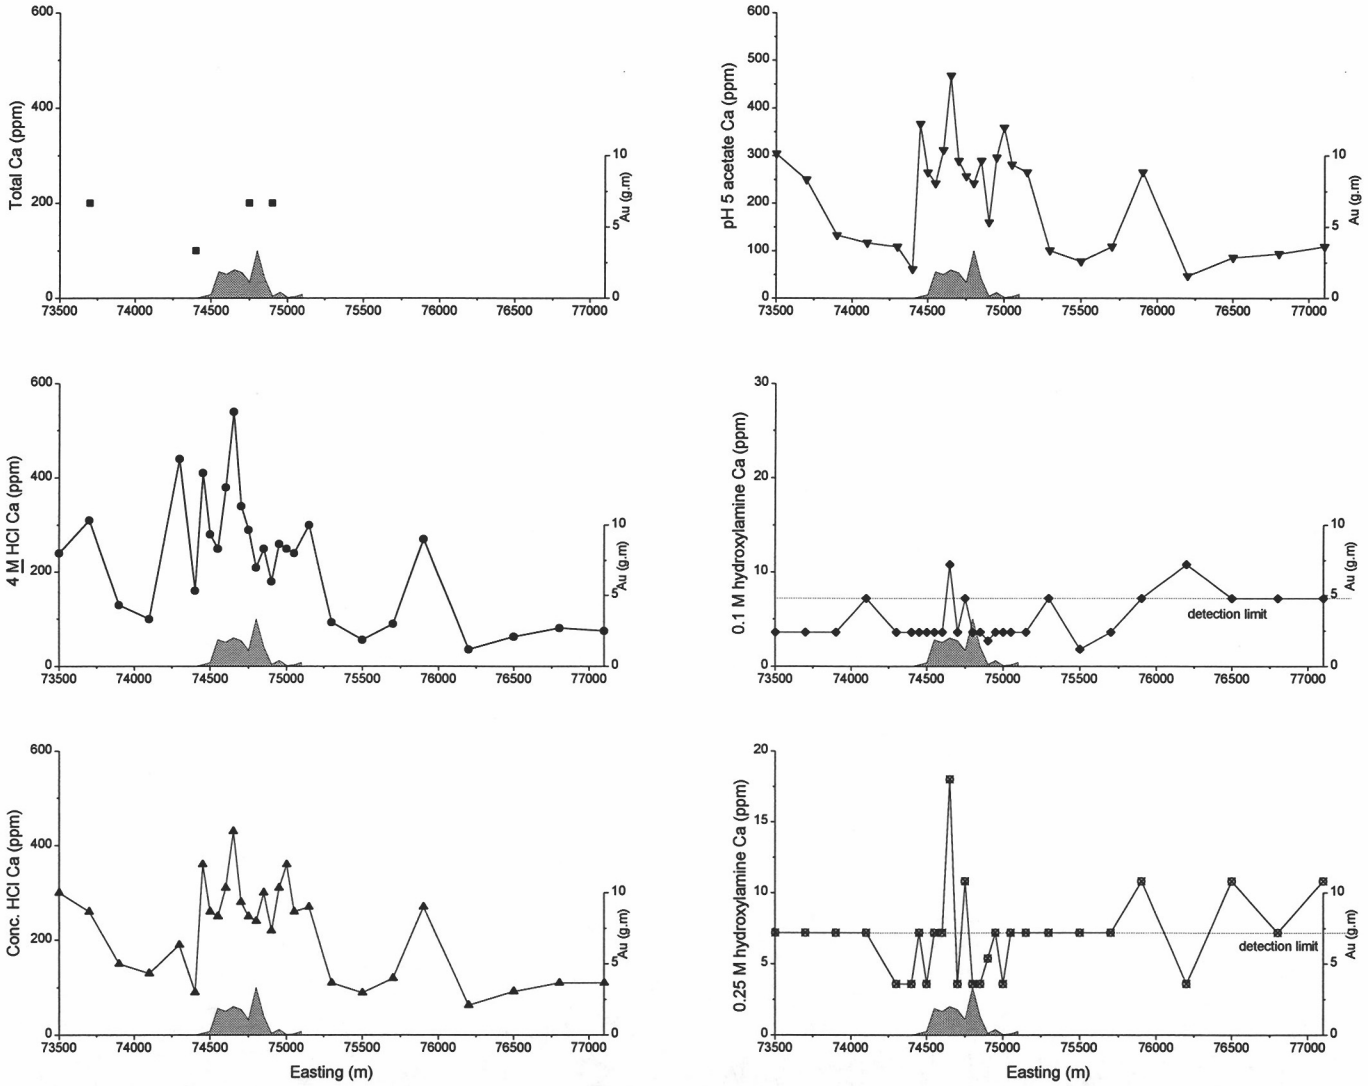

Figure A10.3: Total and extractable Ca from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

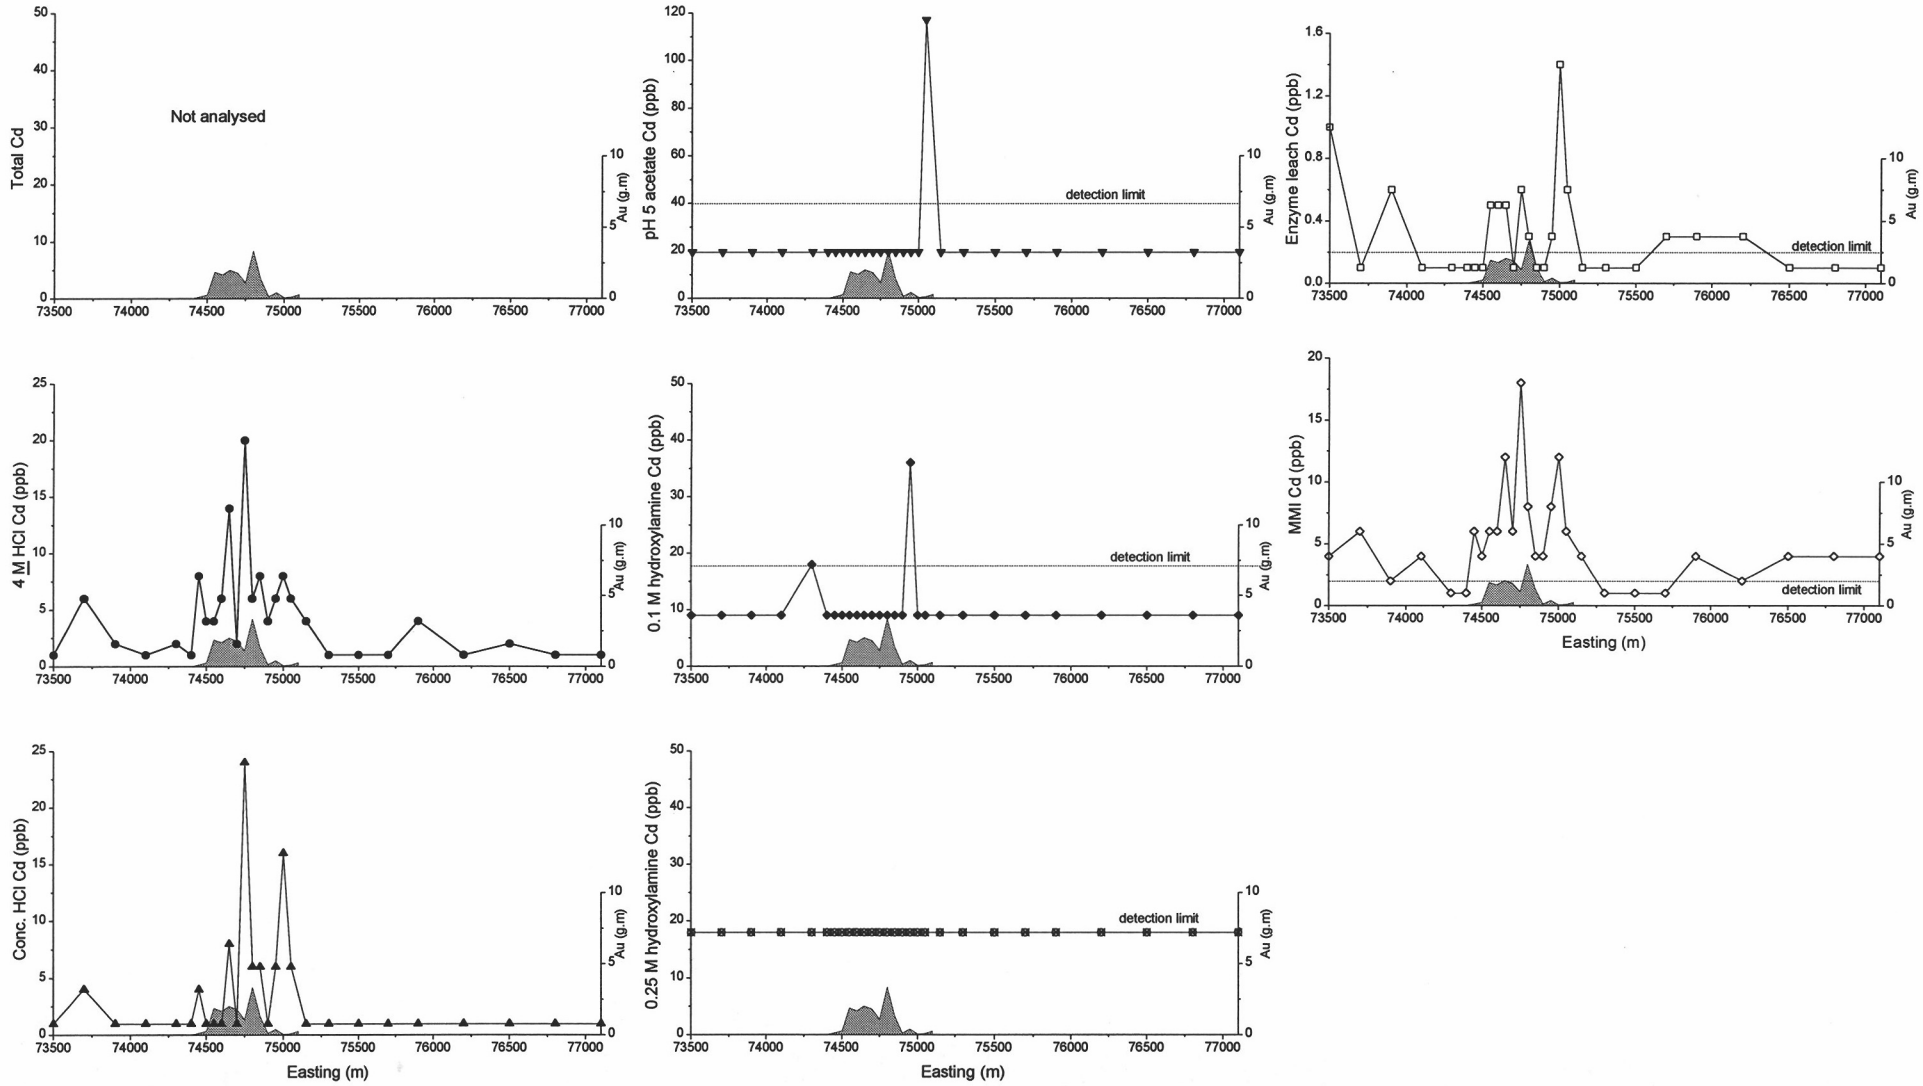

Figure A10.4: Total and extractable Cd from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

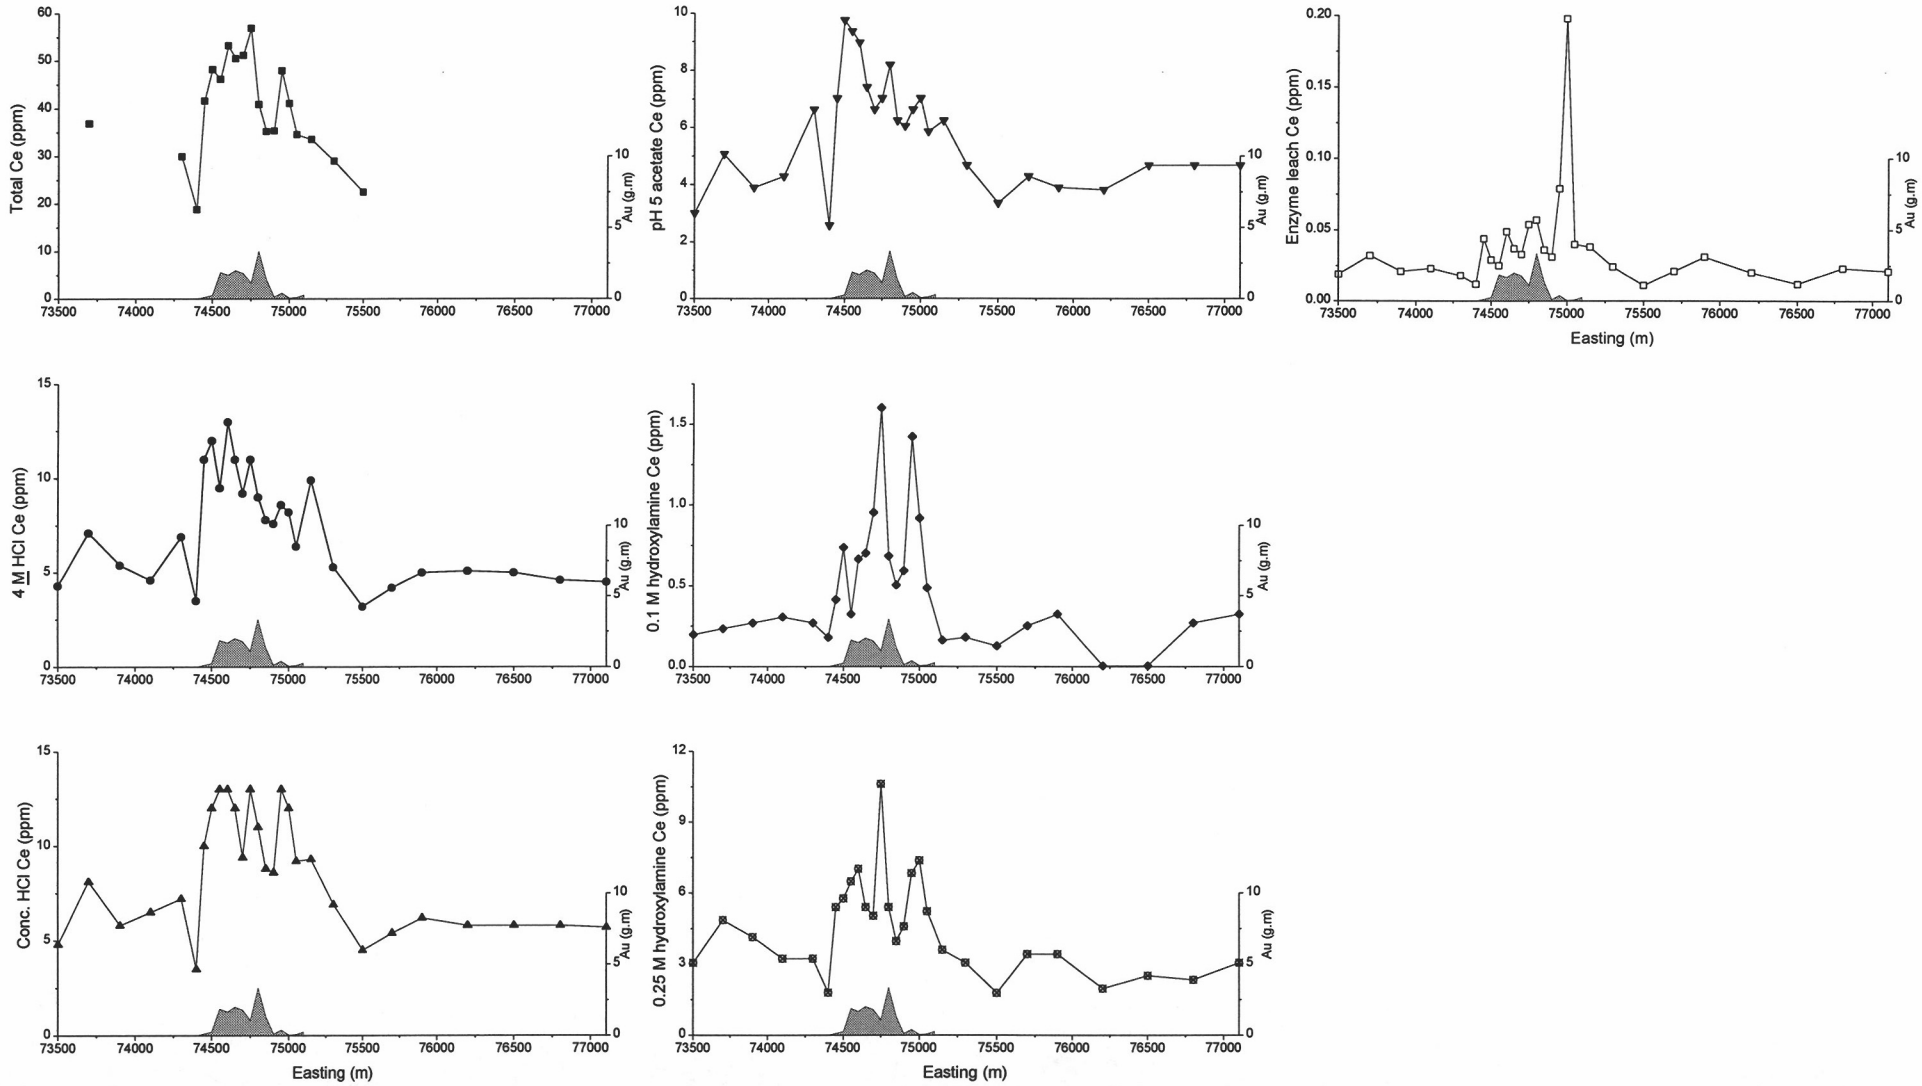

Figure A10.5: Total and extractable Ce from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

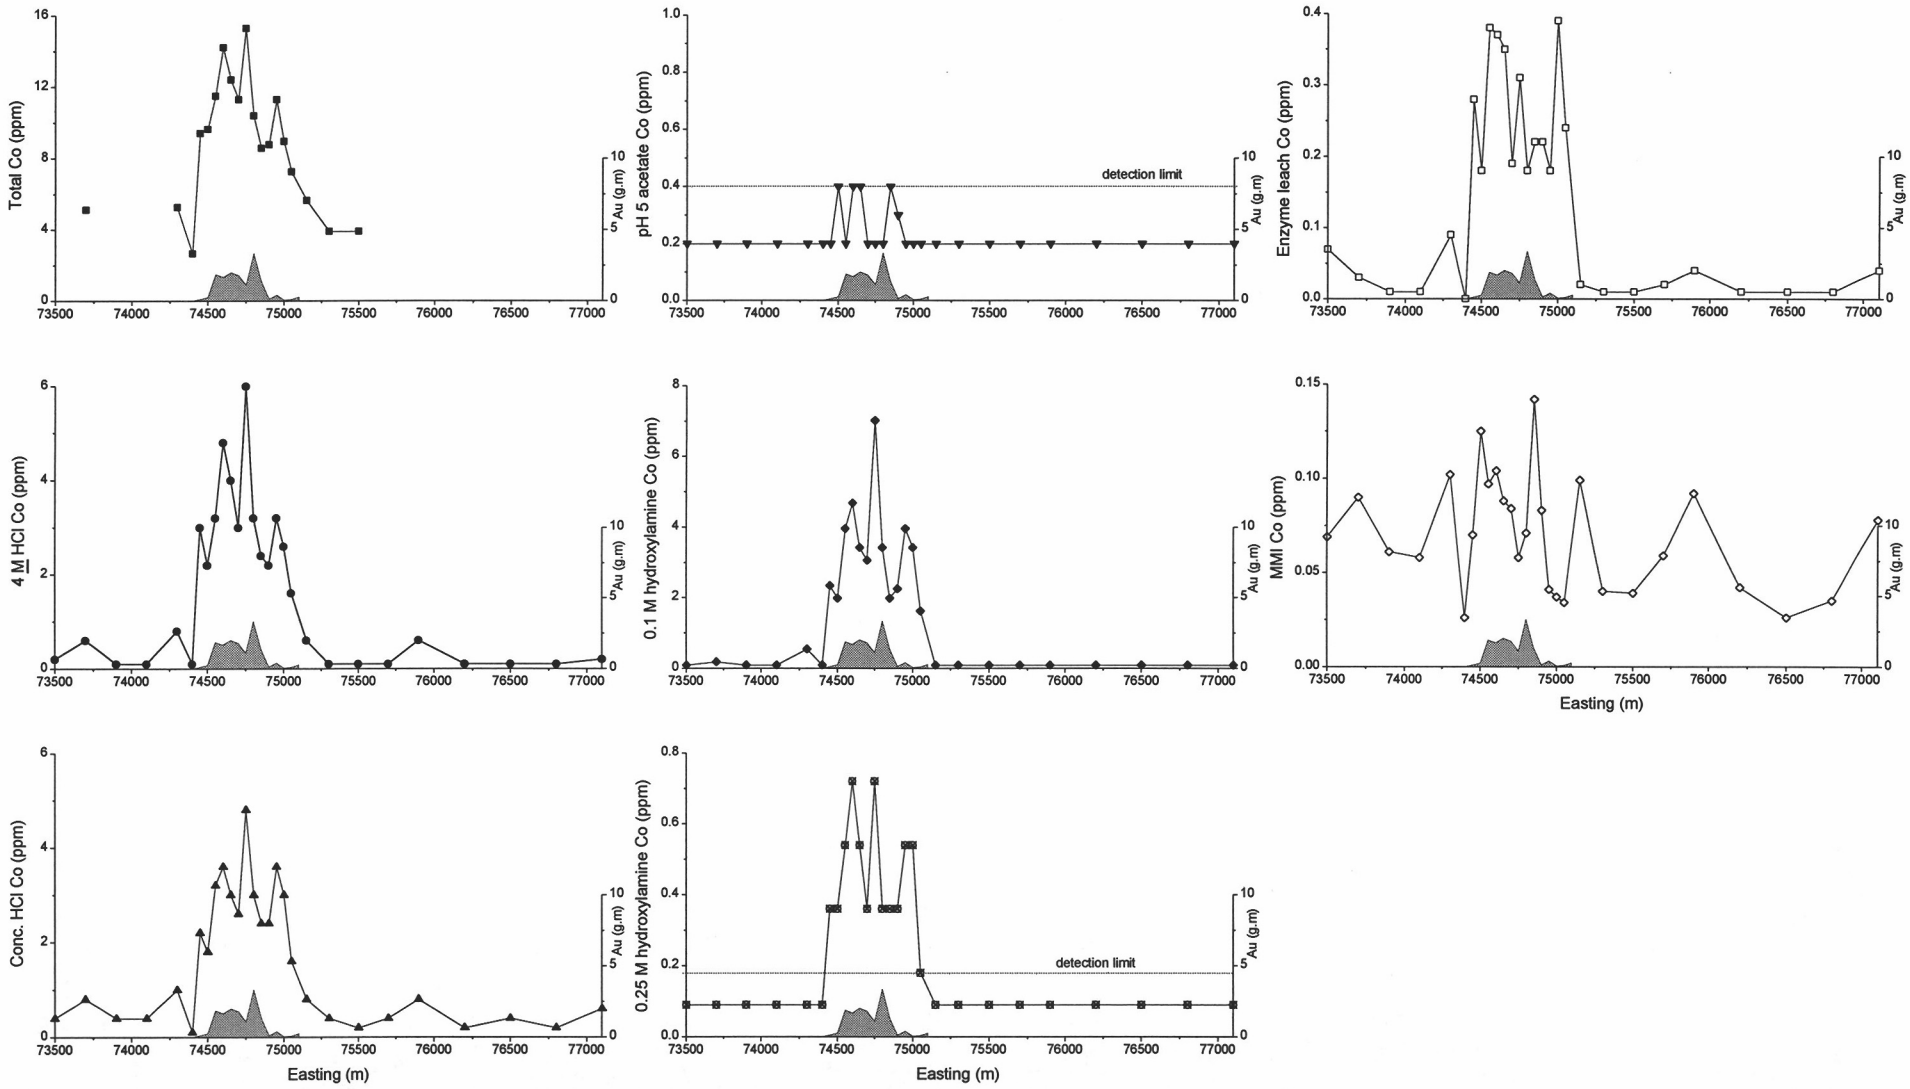

Figure A10.6: Total and extractable Co from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

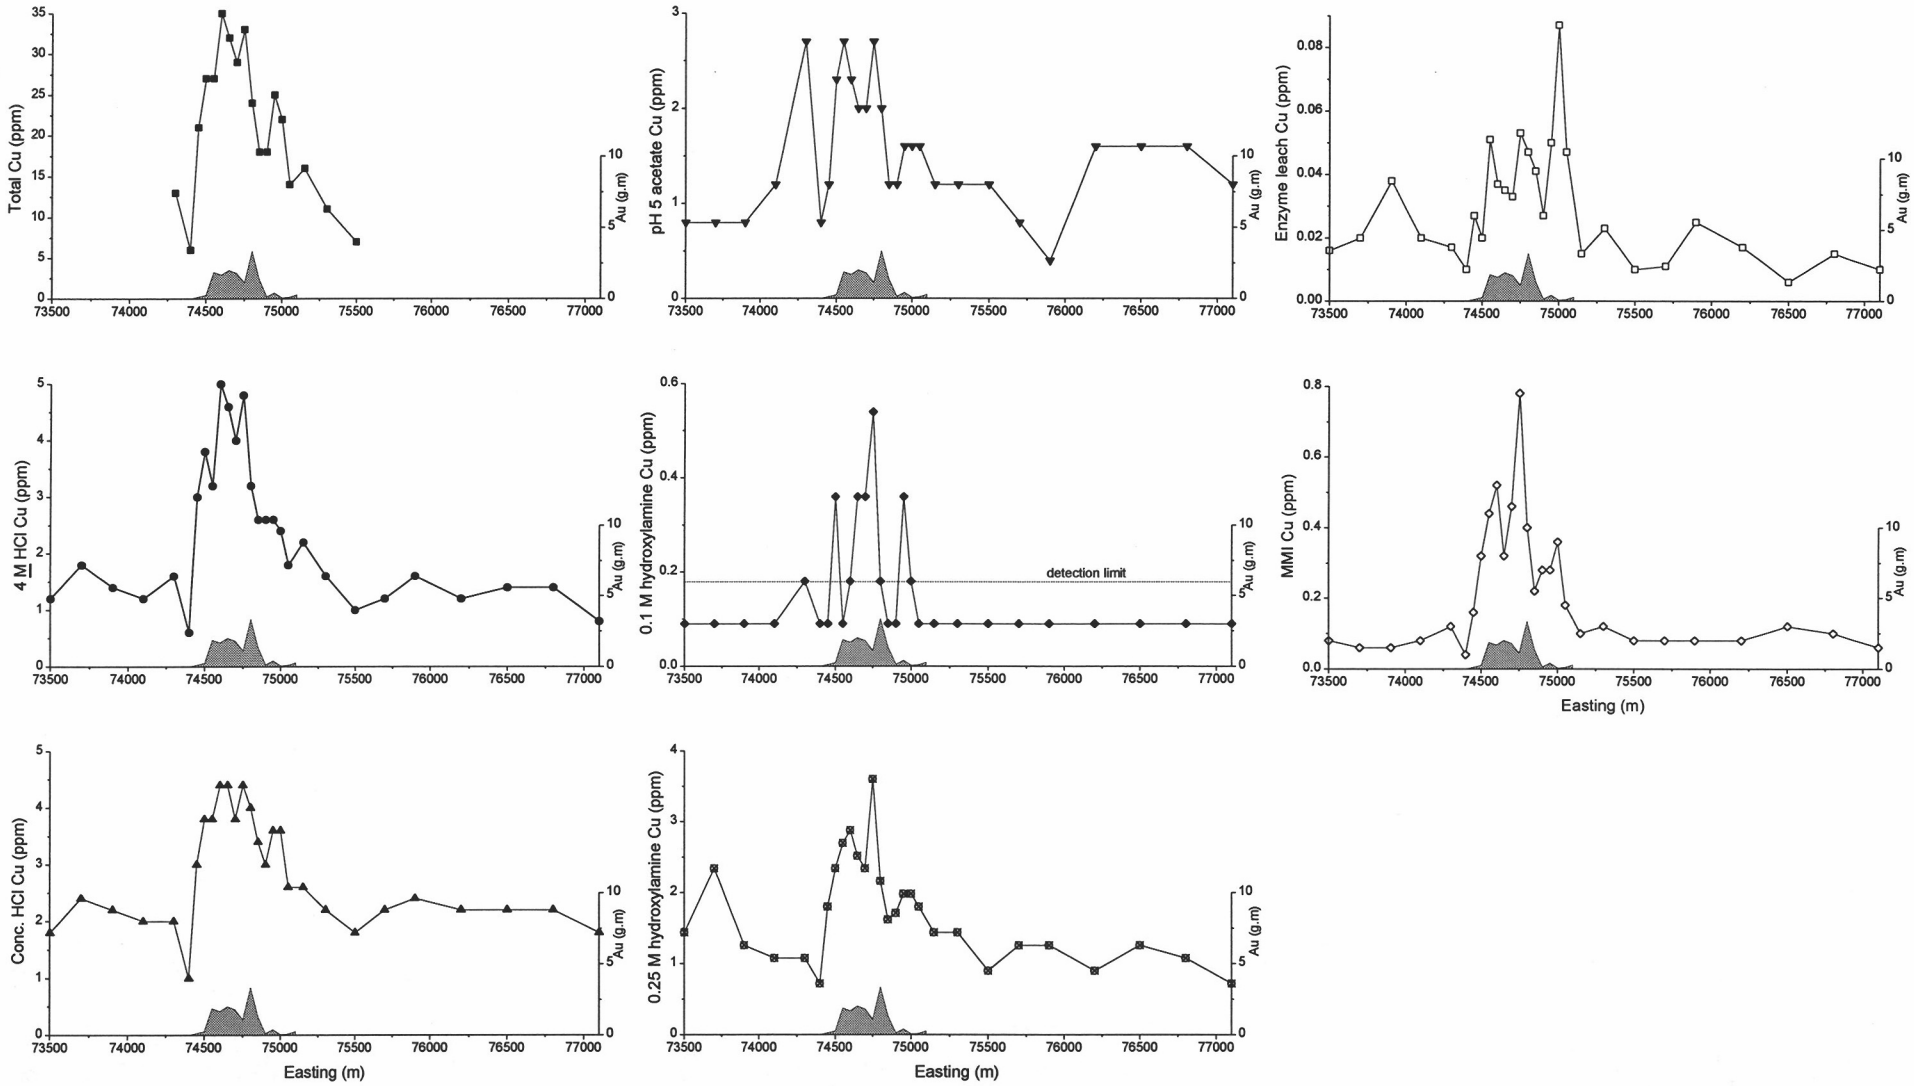

Figure A10.7: Total and extractable Cu from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

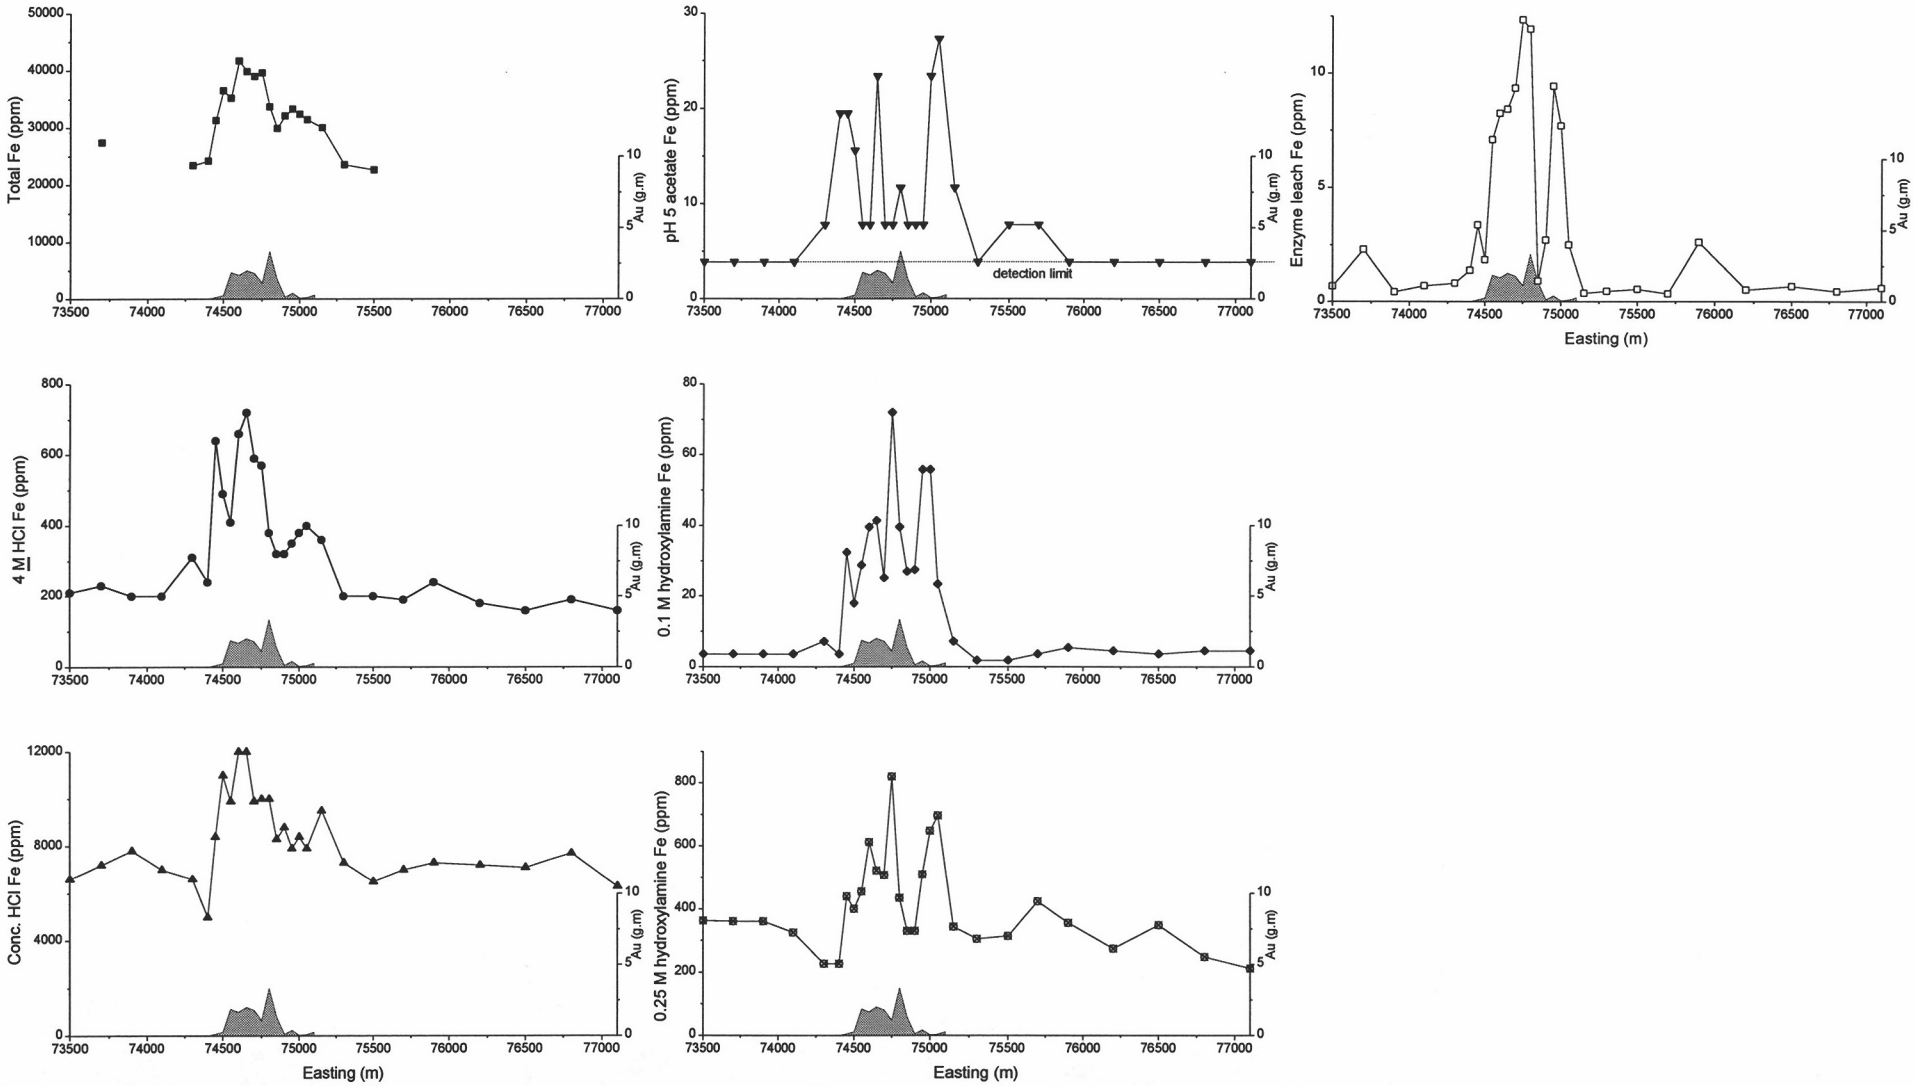

Figure A10.8: Total and extractable Fe from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

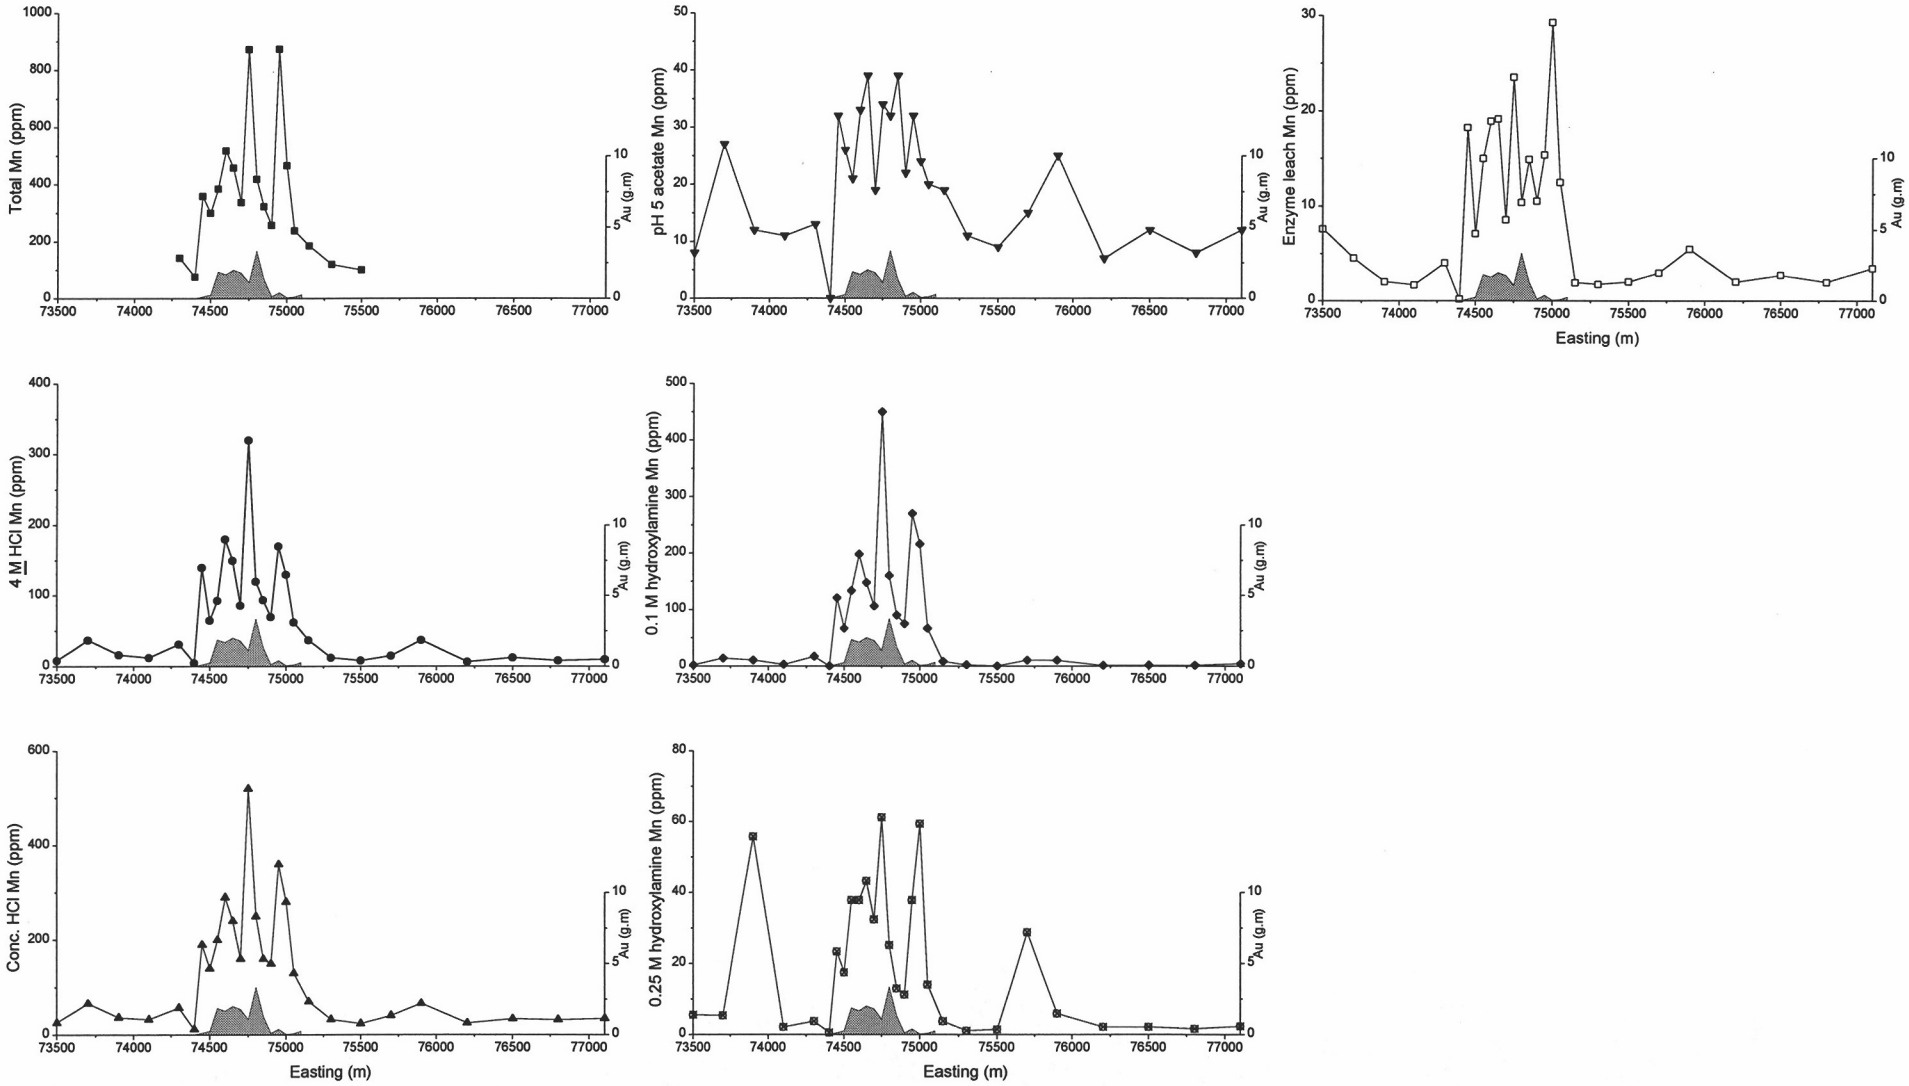

Figure A10.9: Total and extractable Mn from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

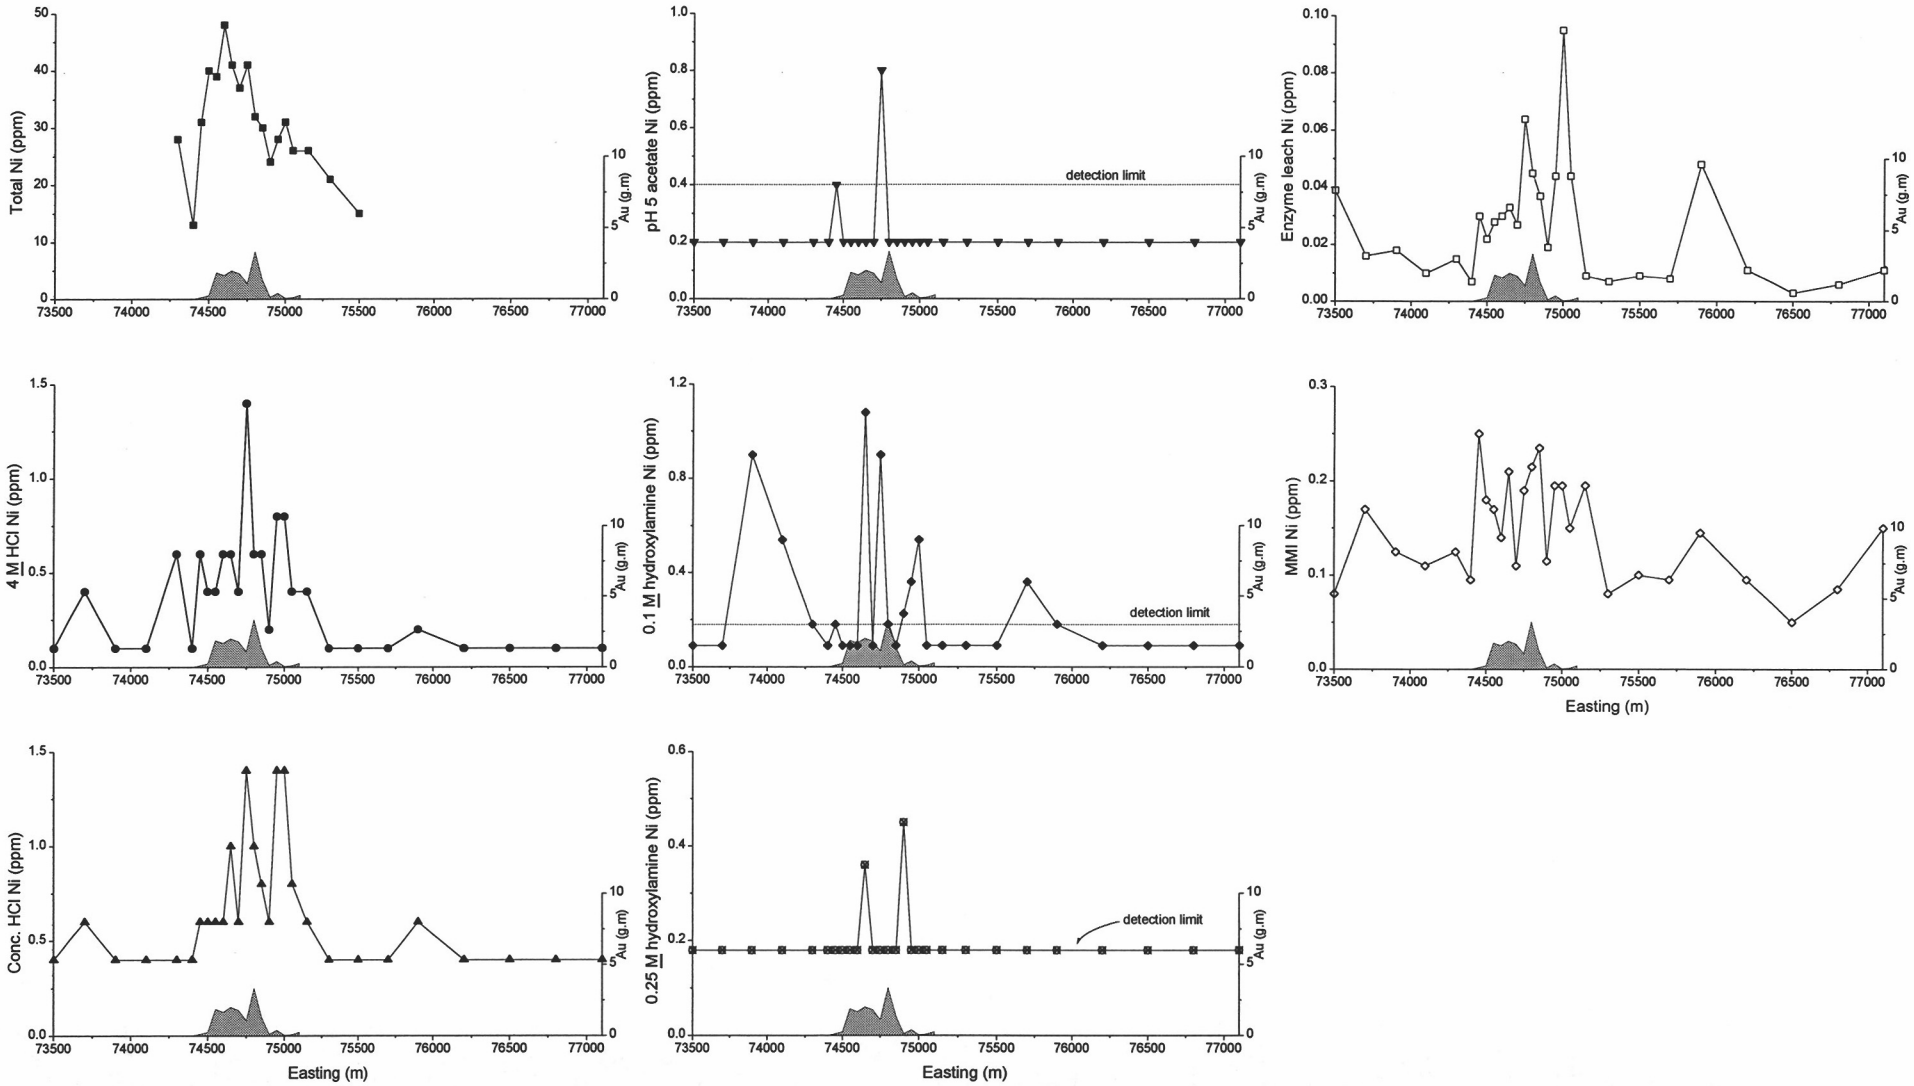

Figure A10.10: Total and extractable Ni from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

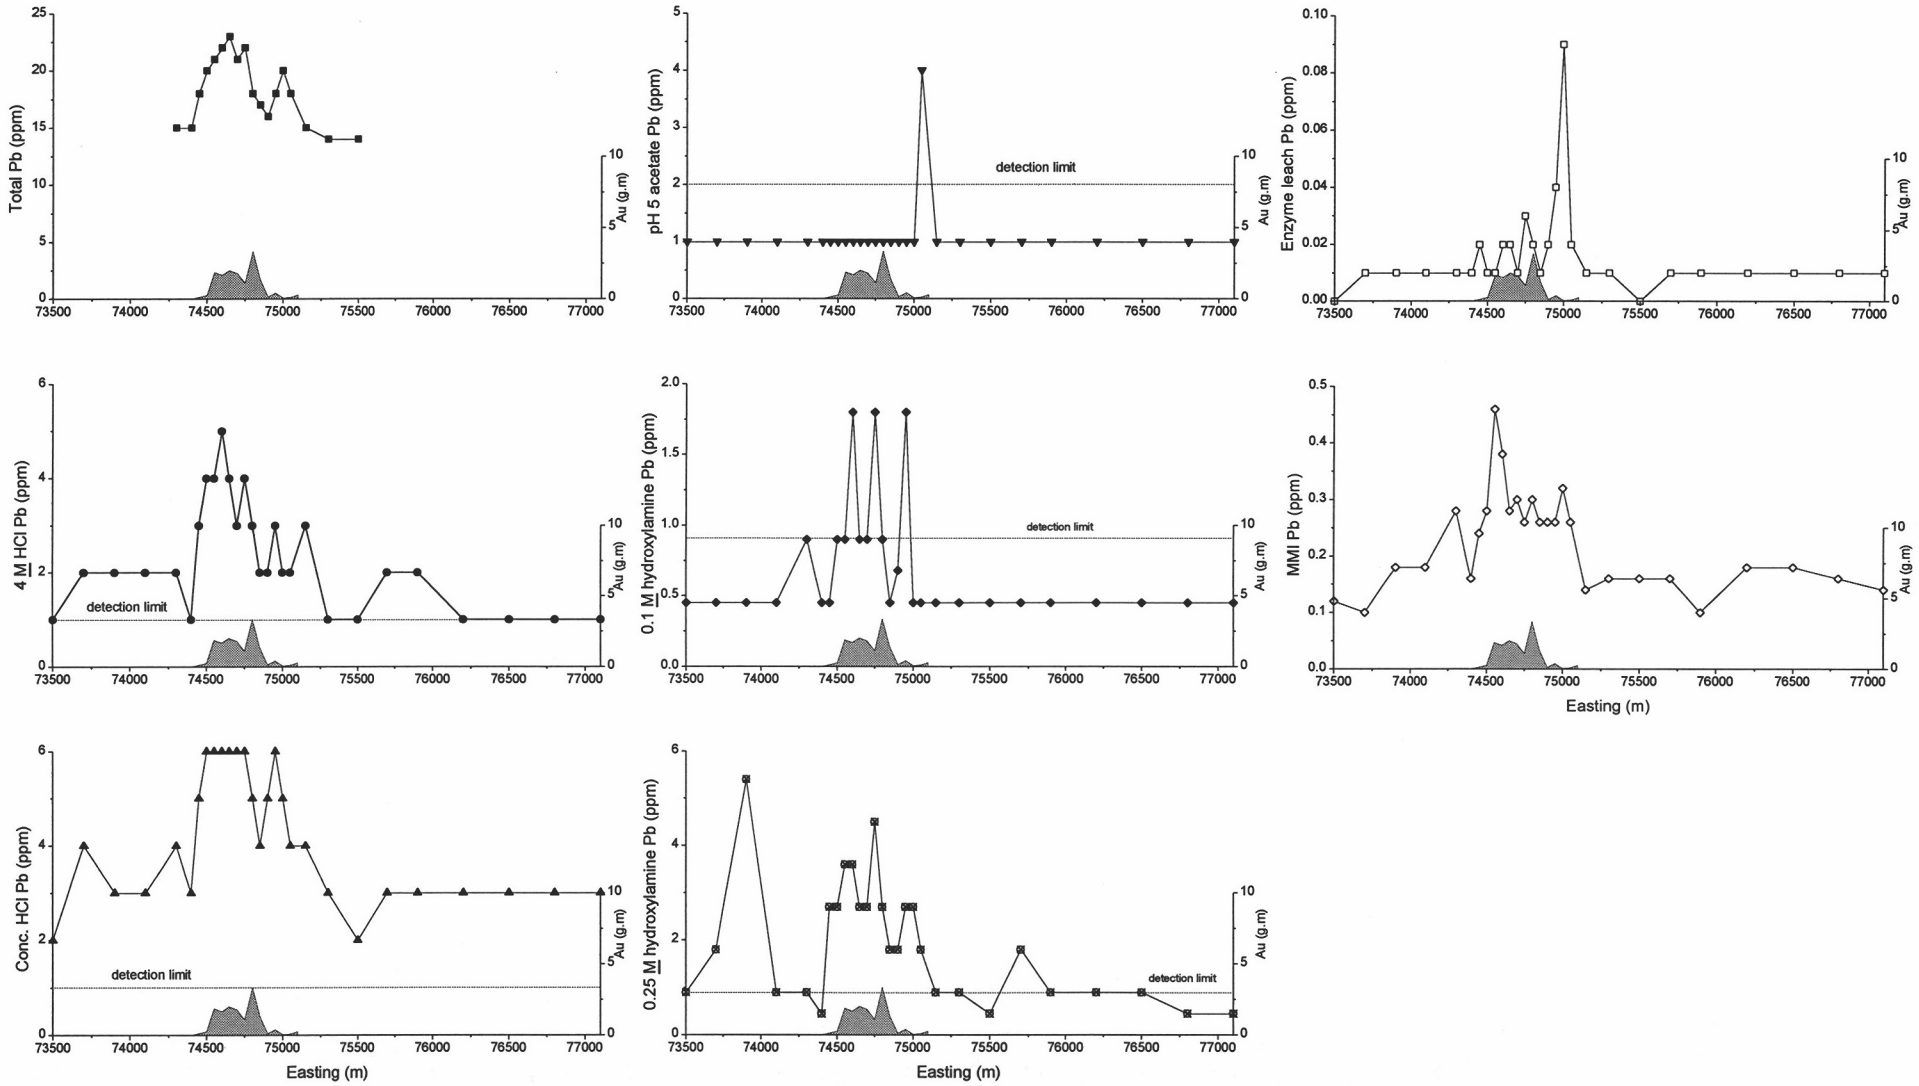

Figure A10.11: Total and extractable Pb from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

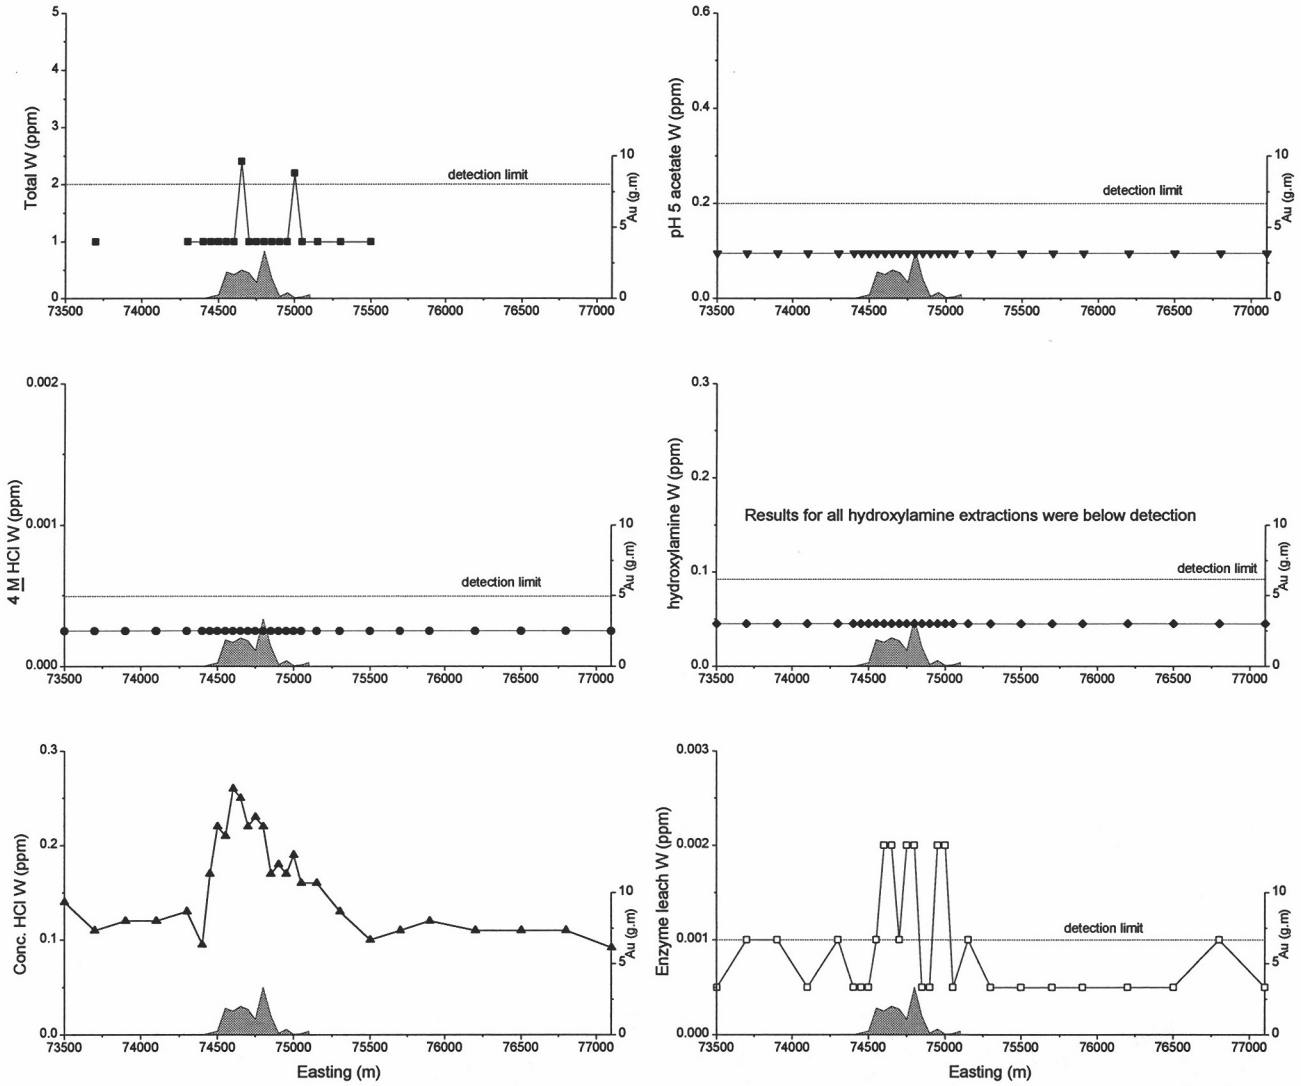

Figure A10.12: Total and extractable W from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

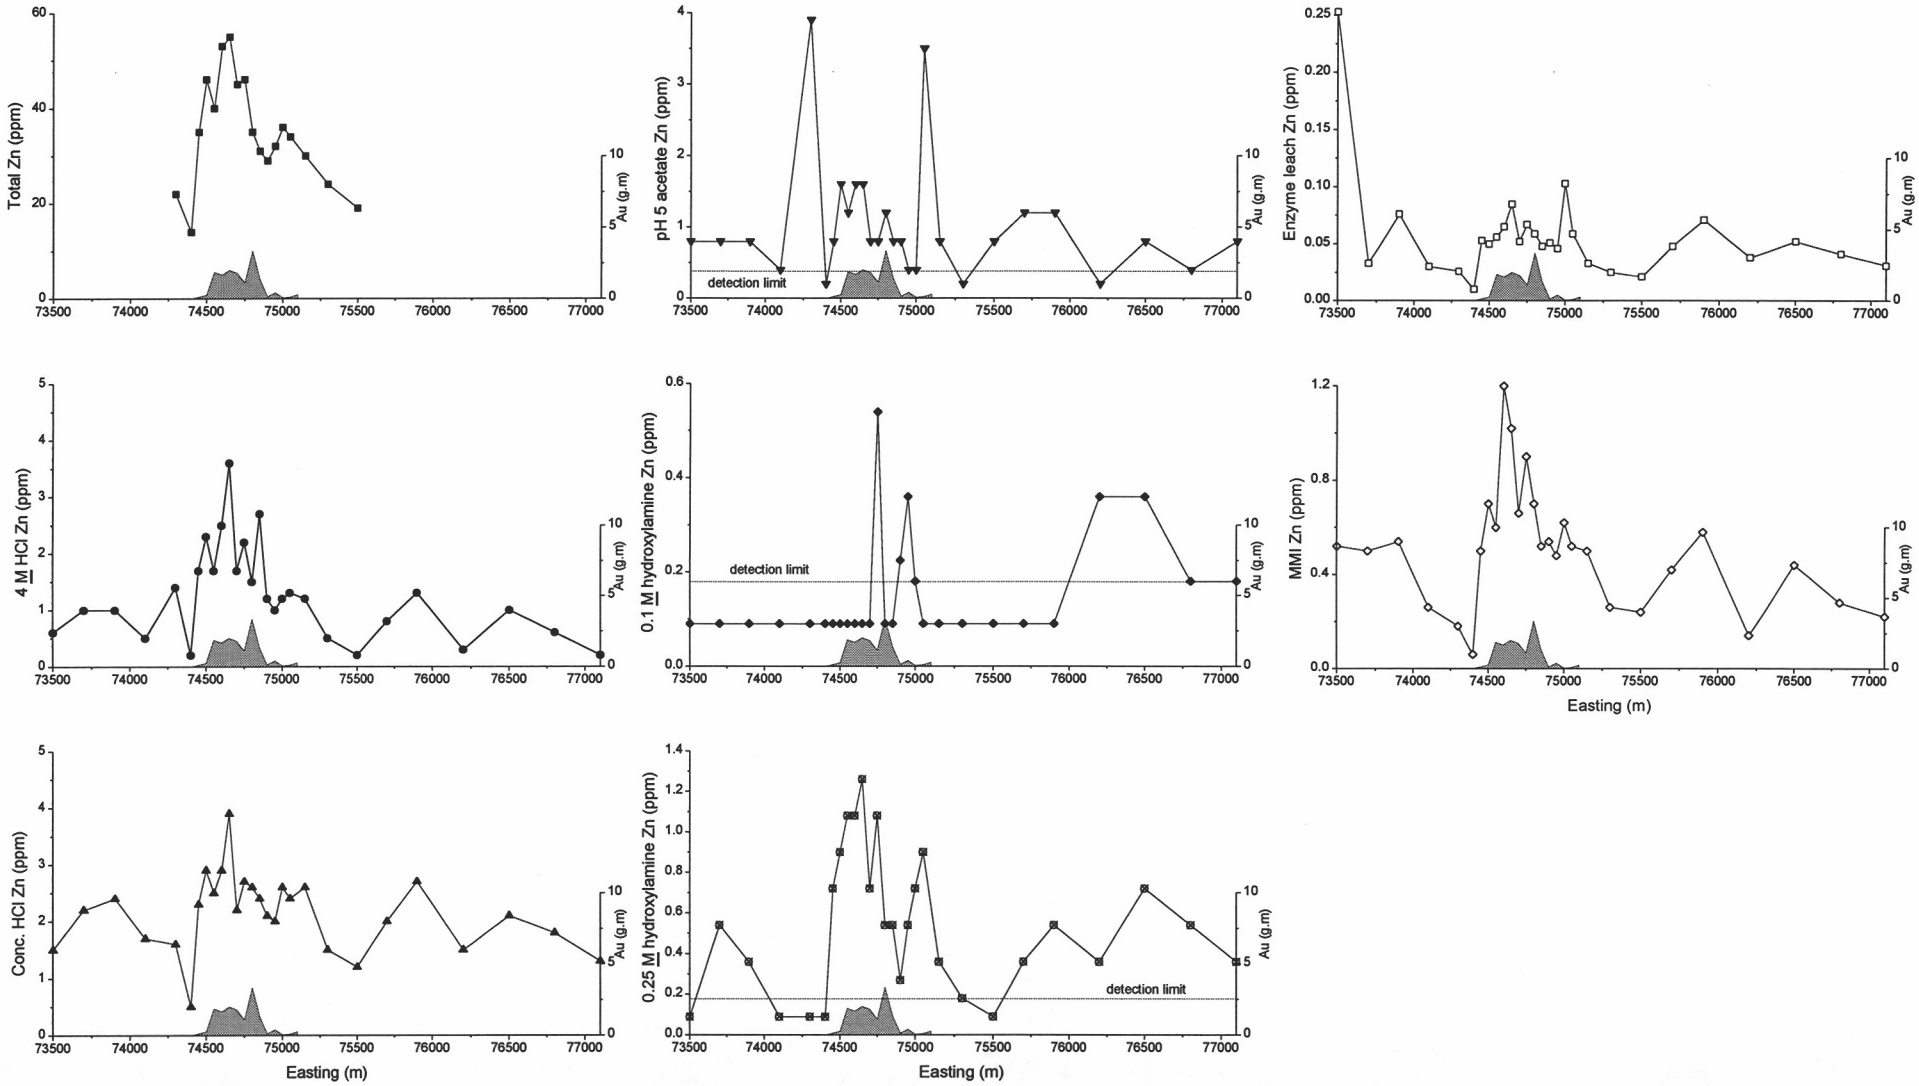

Figure A10.13: Total and extractable Zn from Curara line 27500N.
(Shaded area represents Au content of buried laterite).

Appendix 11: Traverse Data for Safari

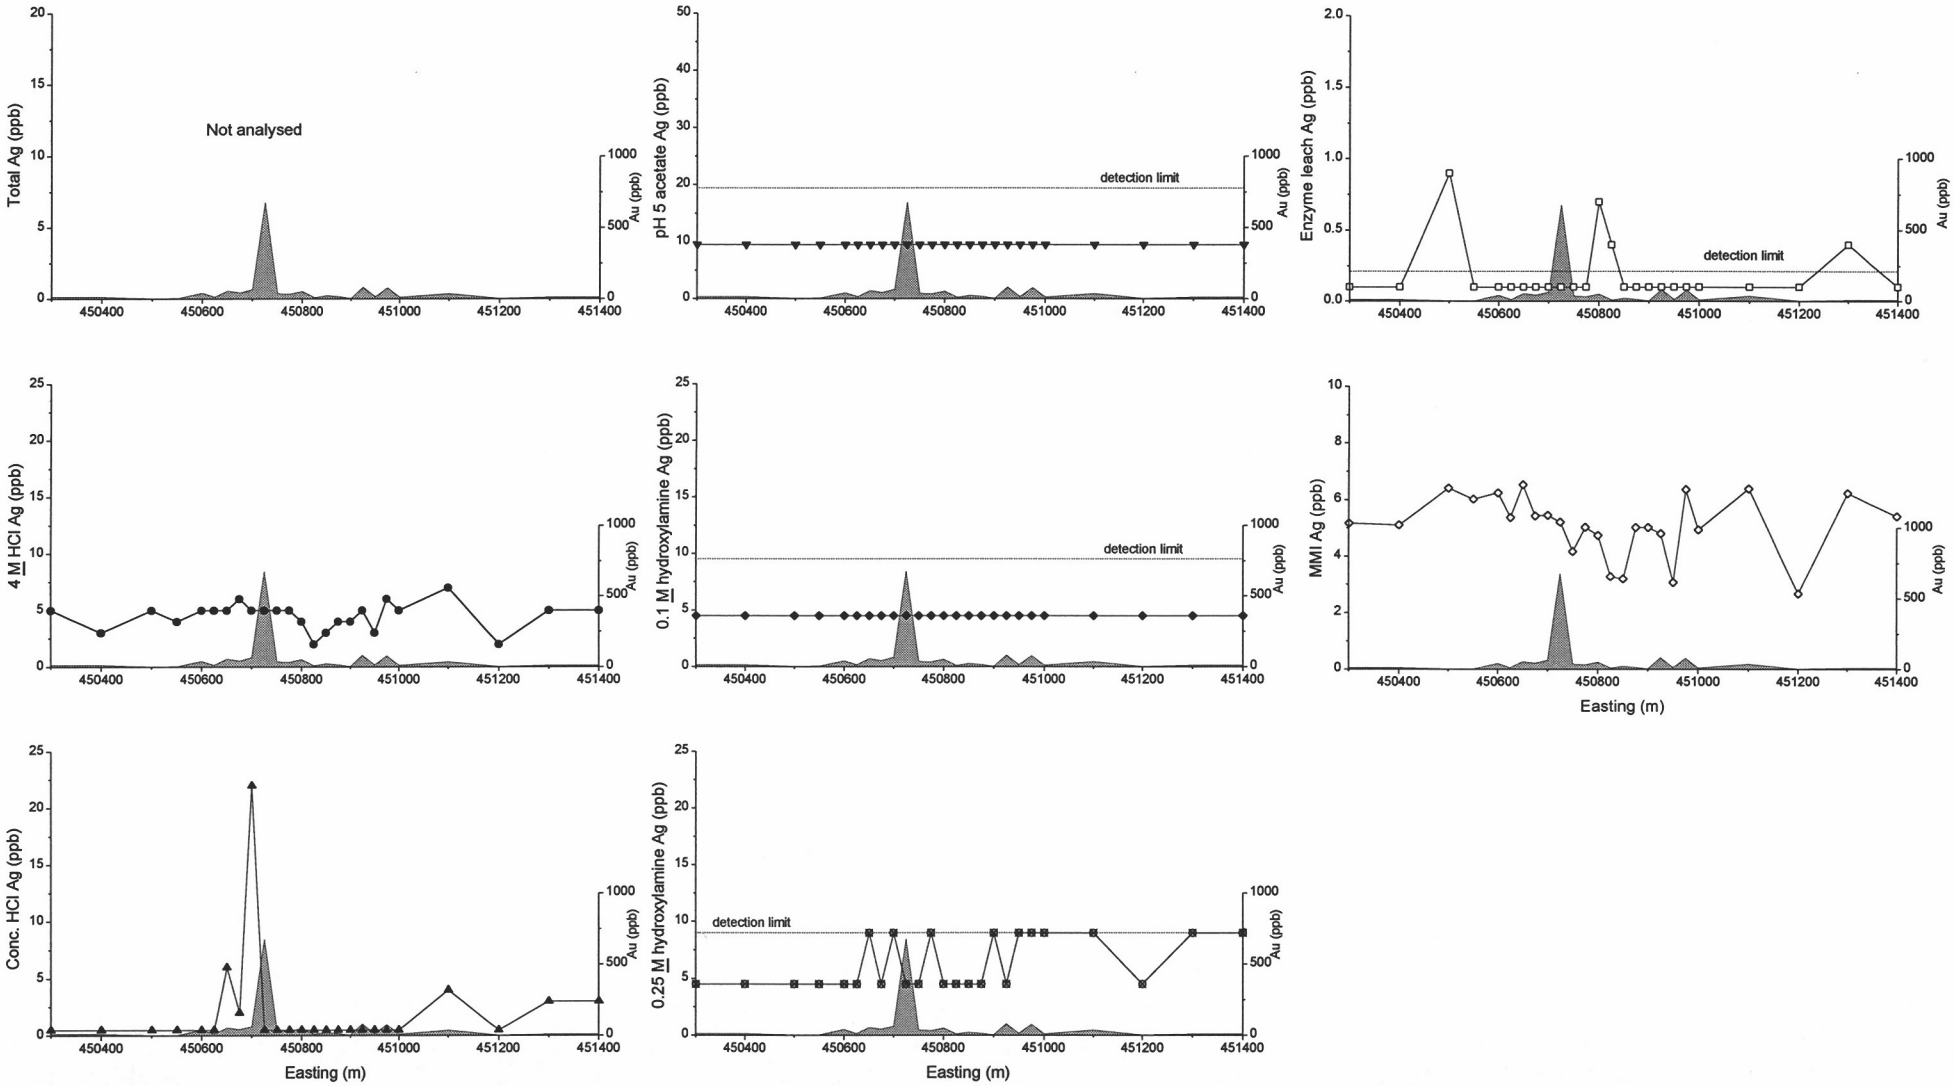

Figure A11.1: Total and extractable Ag from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

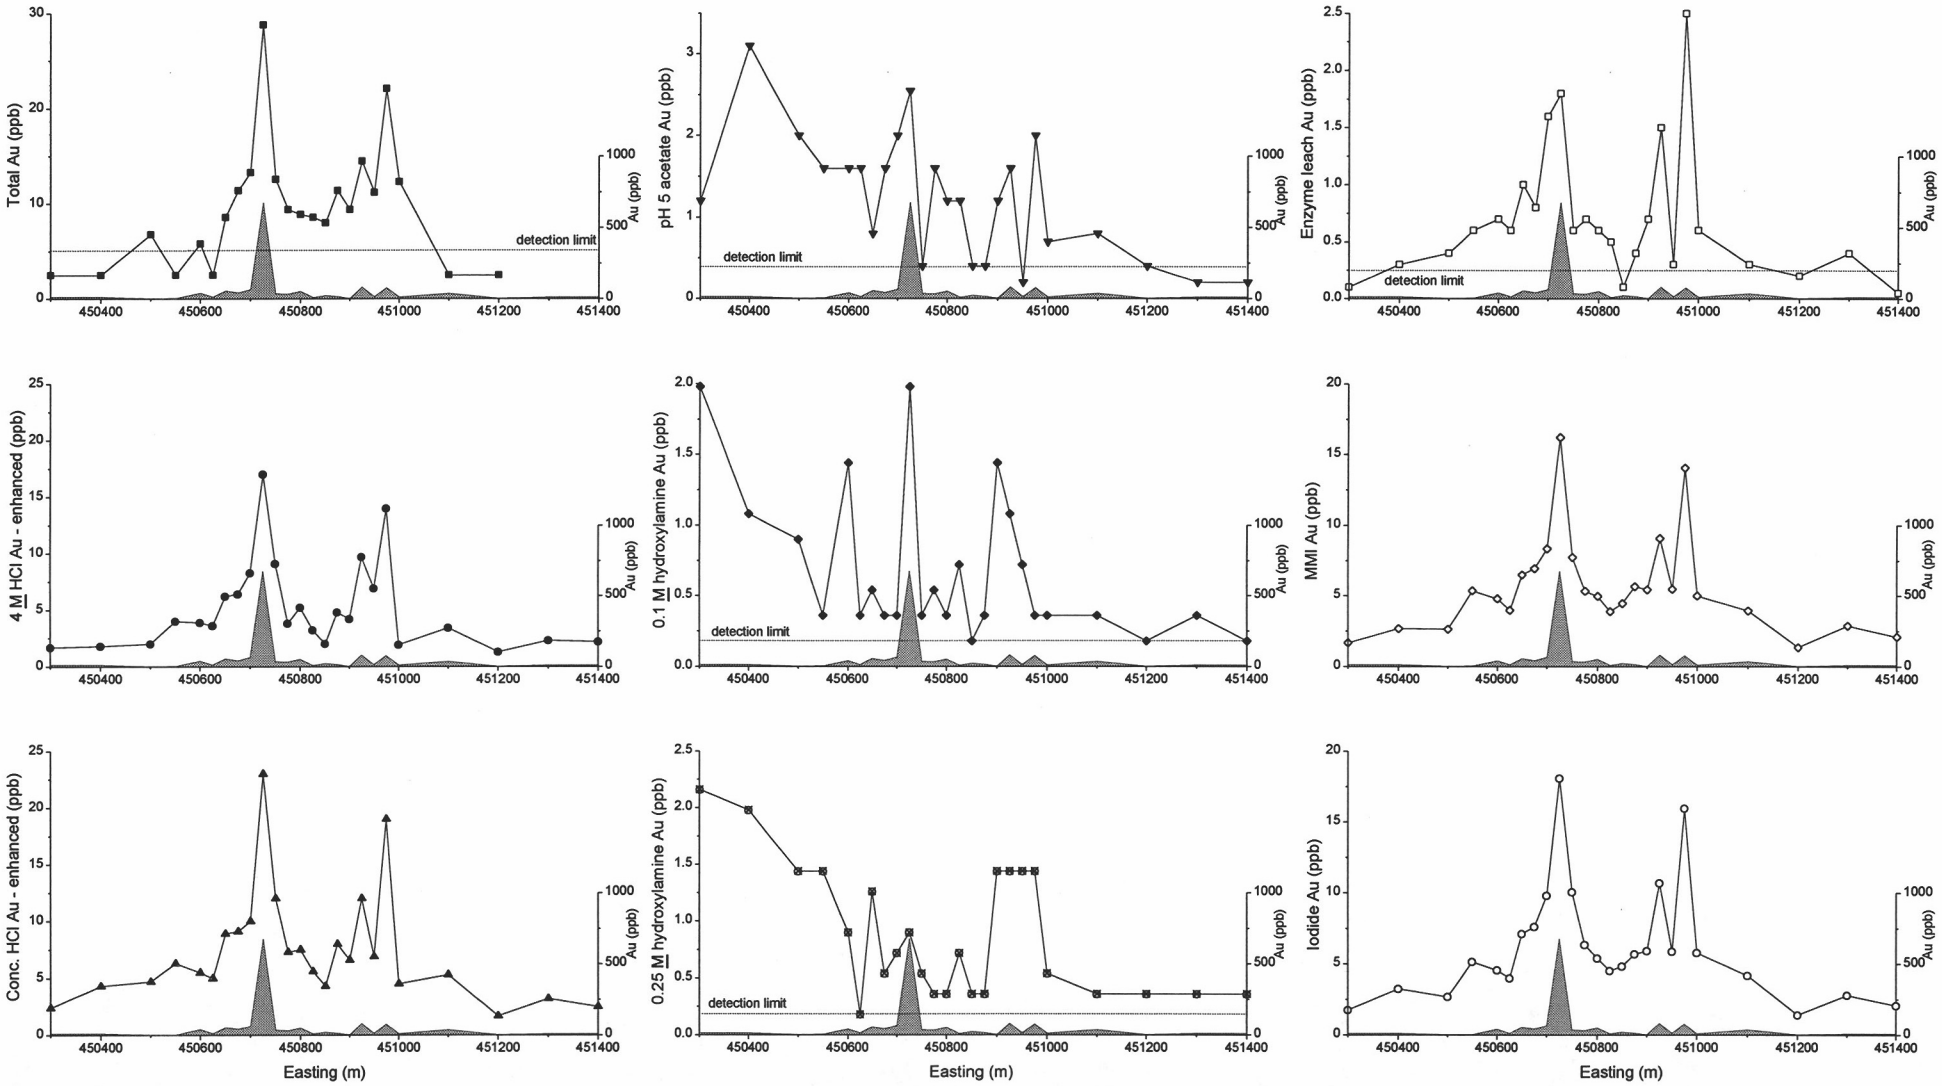

Figure A11.2: Total and extractable Au from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

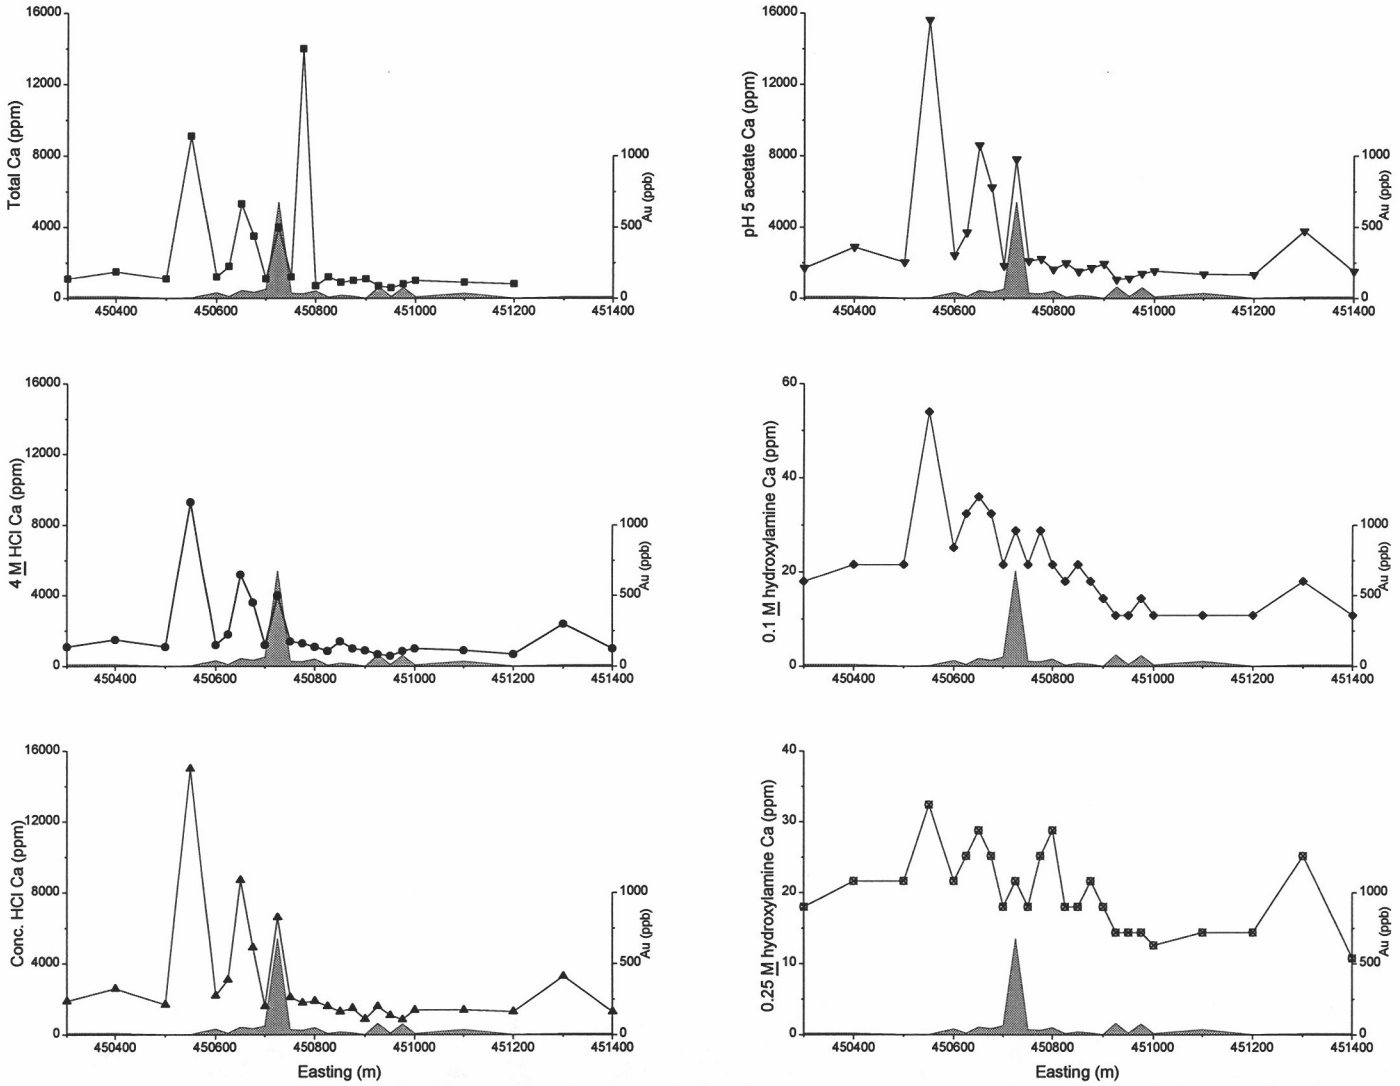

Figure A11.3: Total and extractable Ca from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

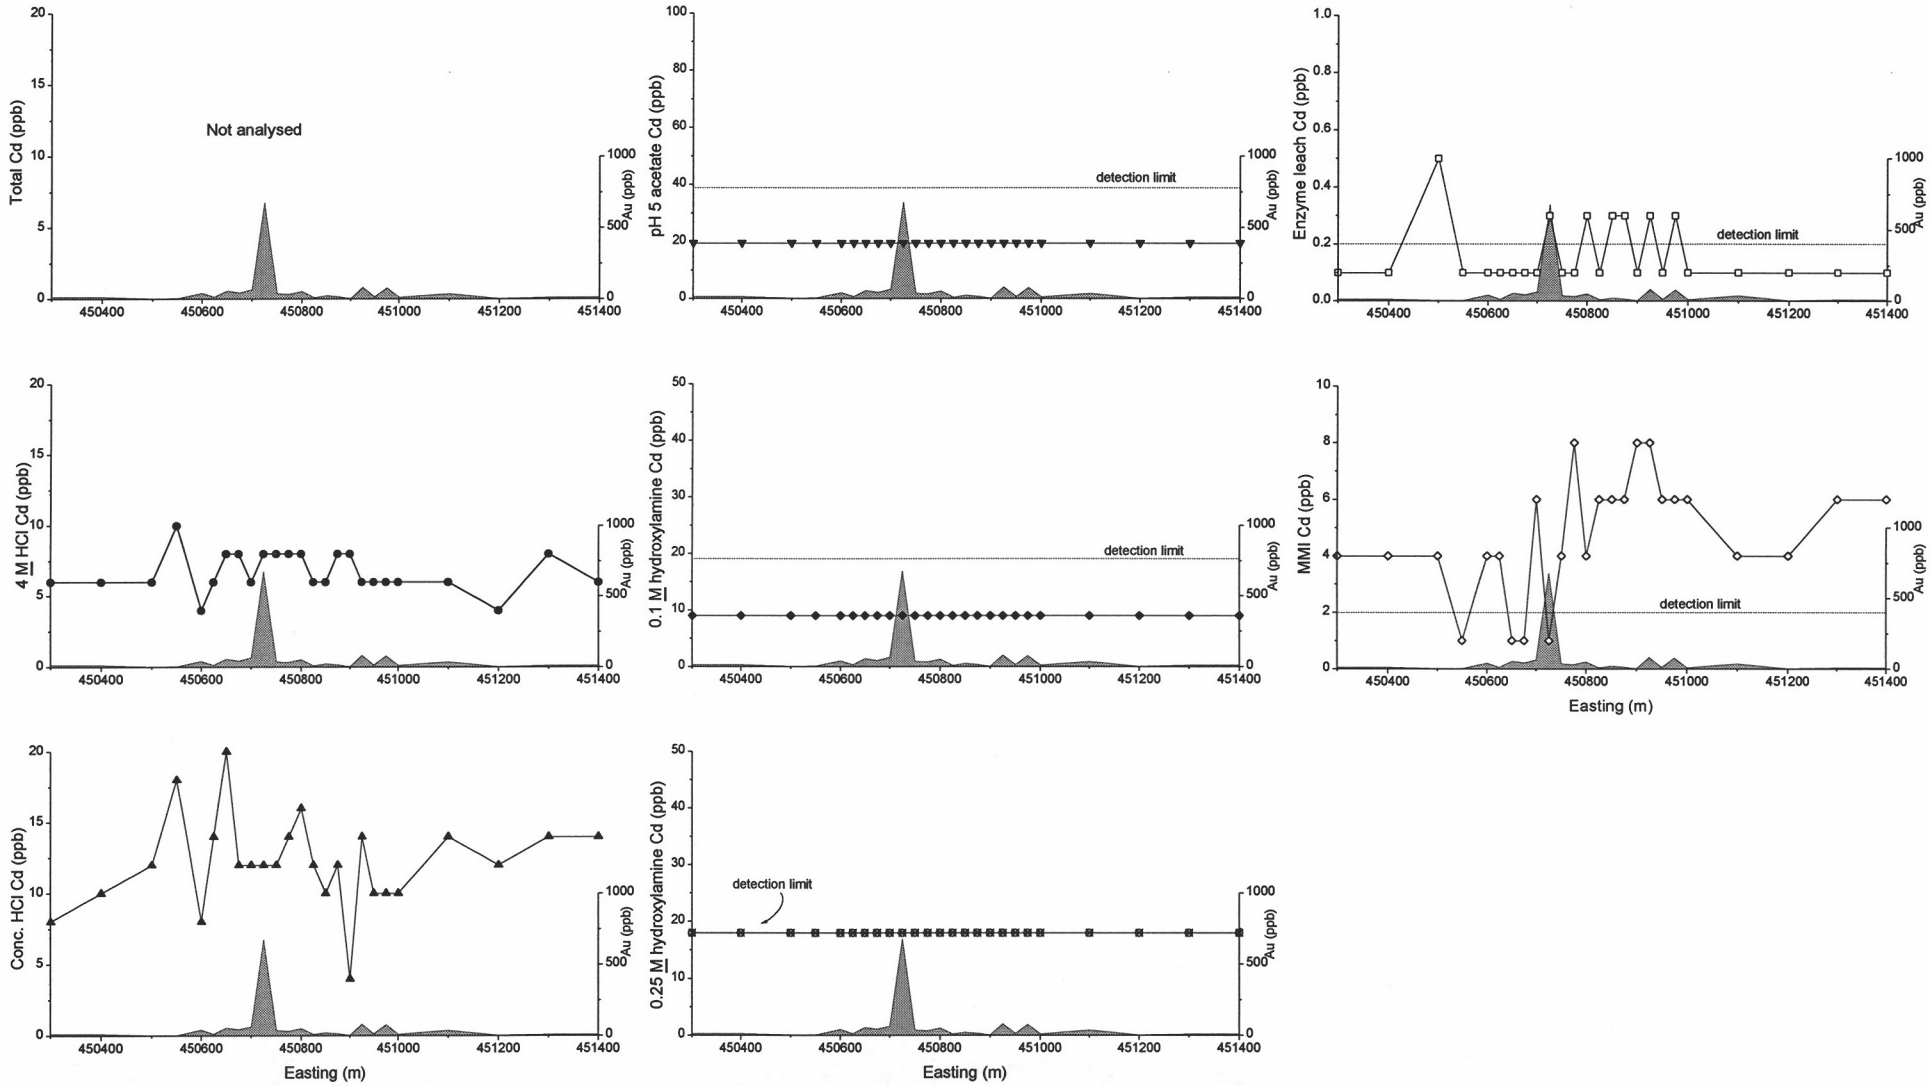

Figure A11.4: Total and extractable Cd from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

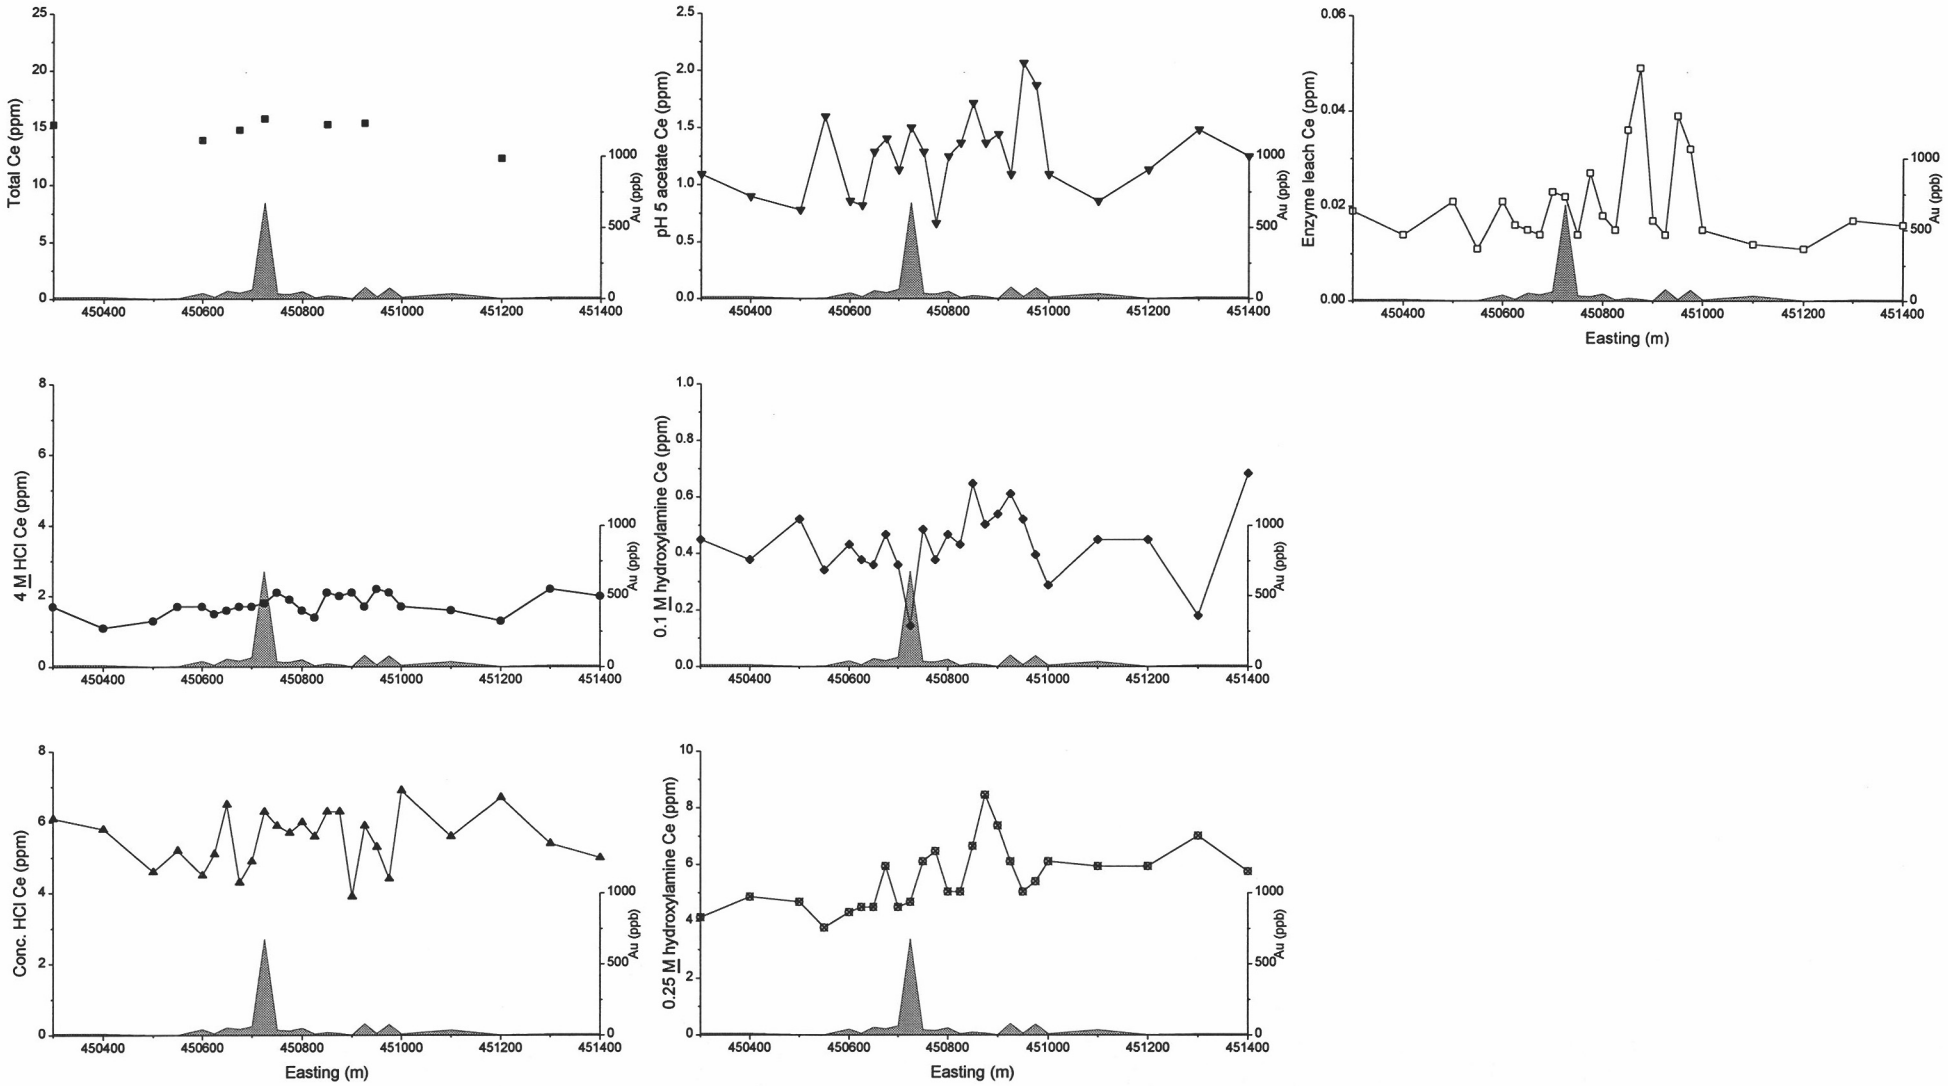

Figure A11.5: Total and extractable Ce from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

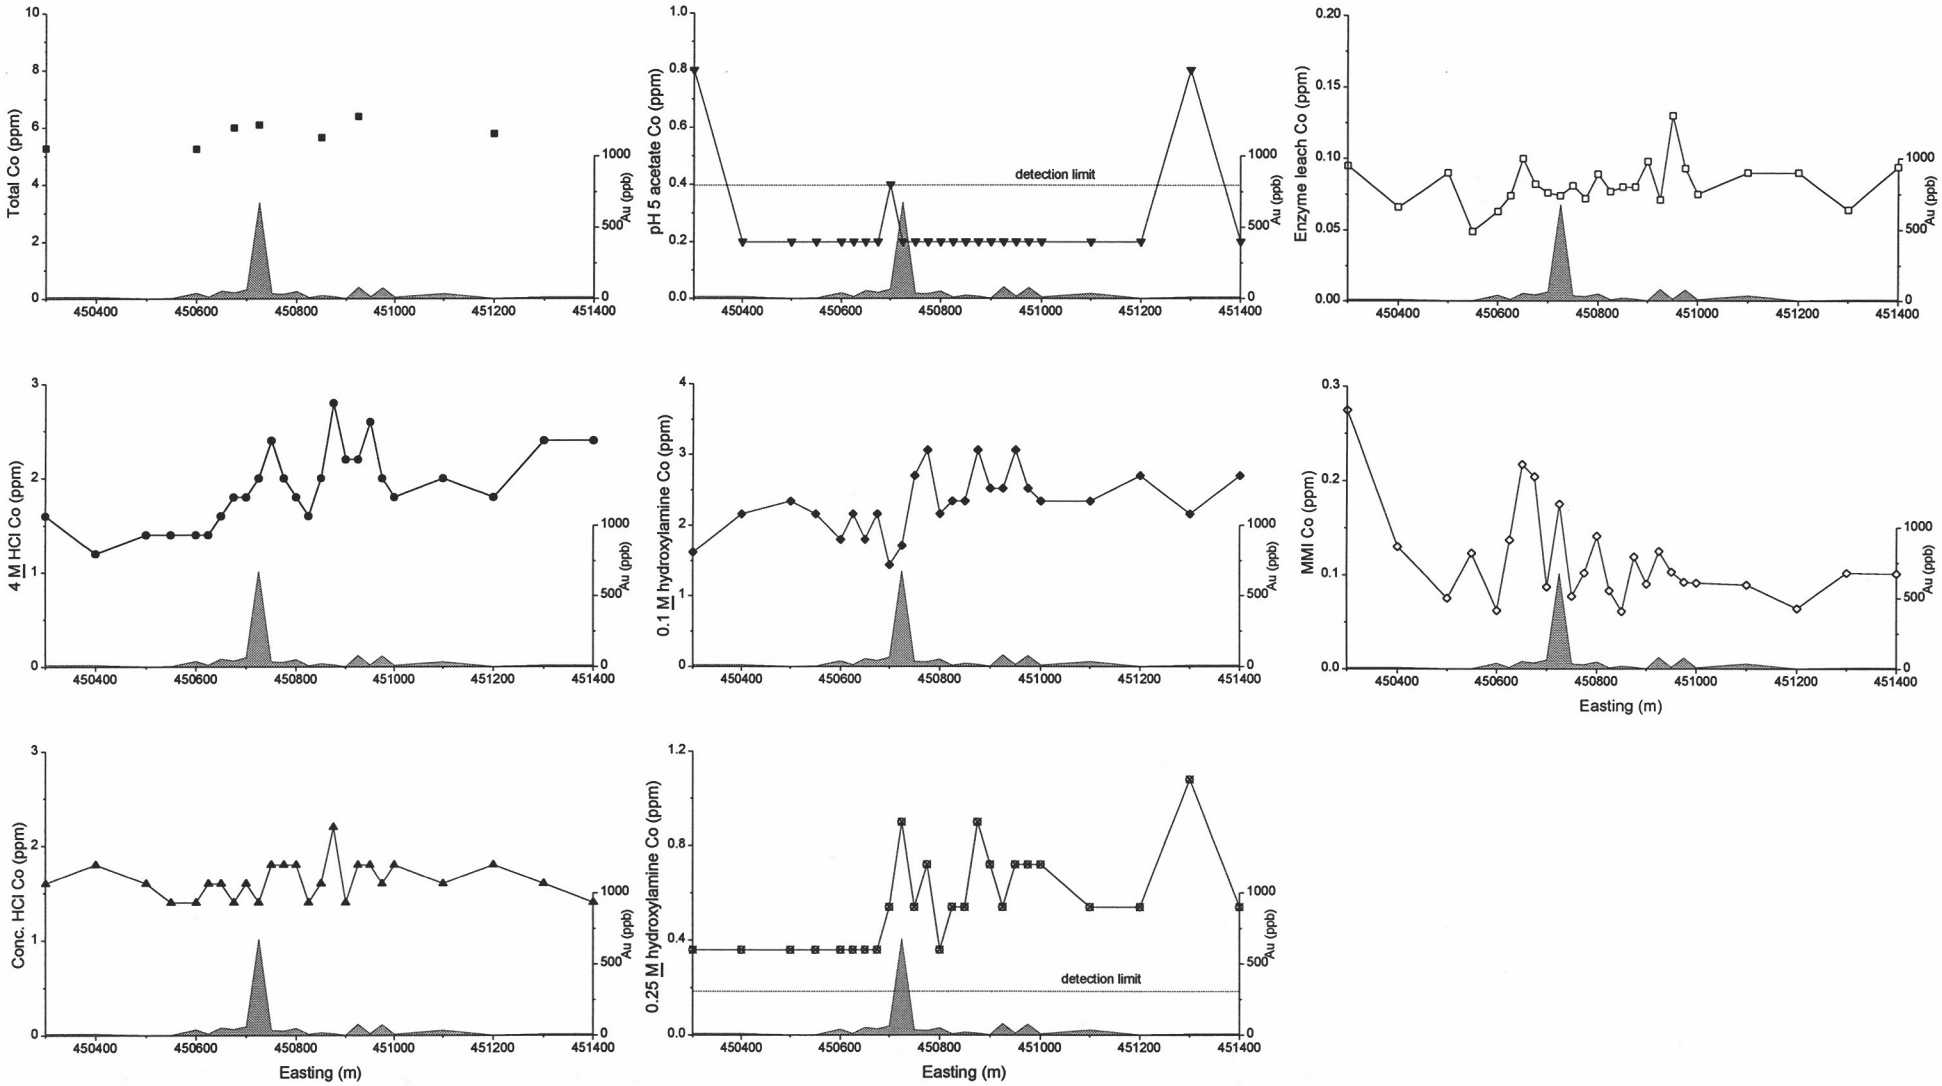

Figure A11.6: Total and extractable Co from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

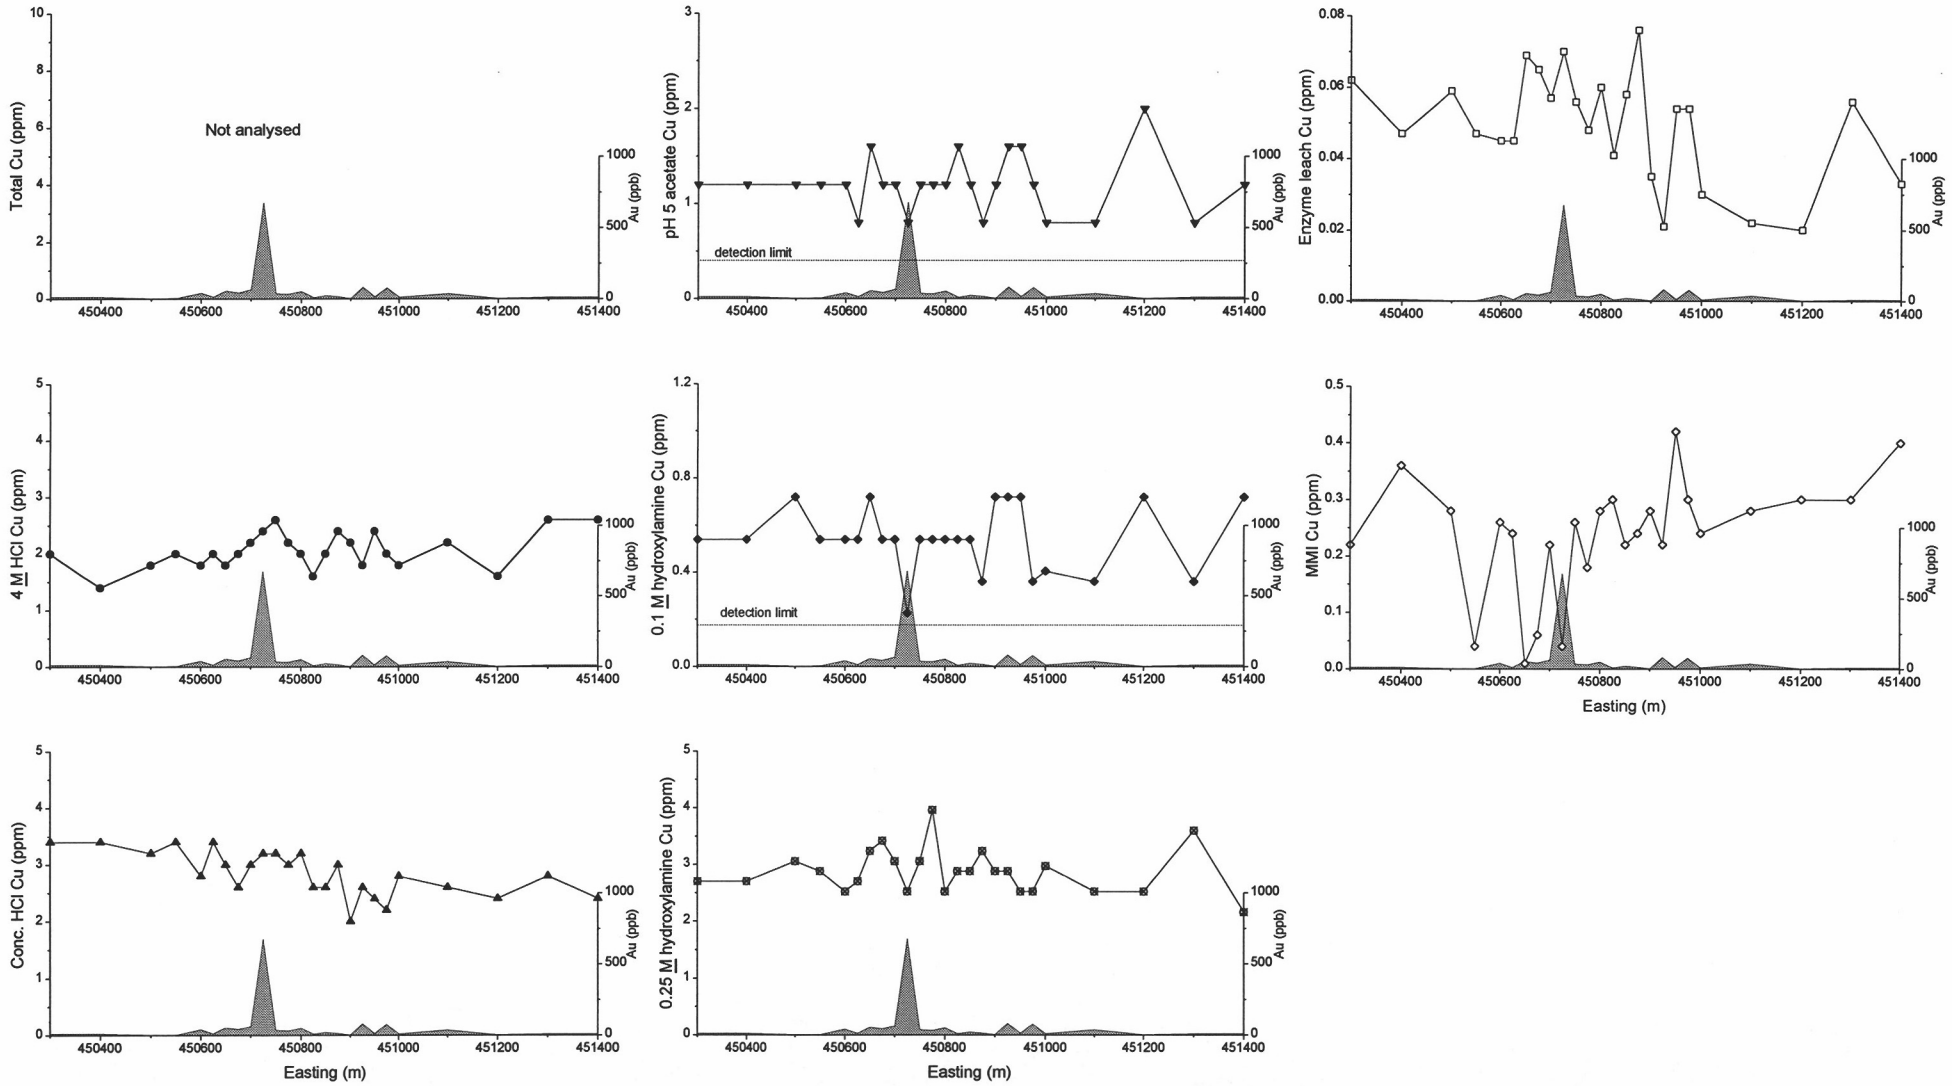

Figure A11.7: Total and extractable Cu from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

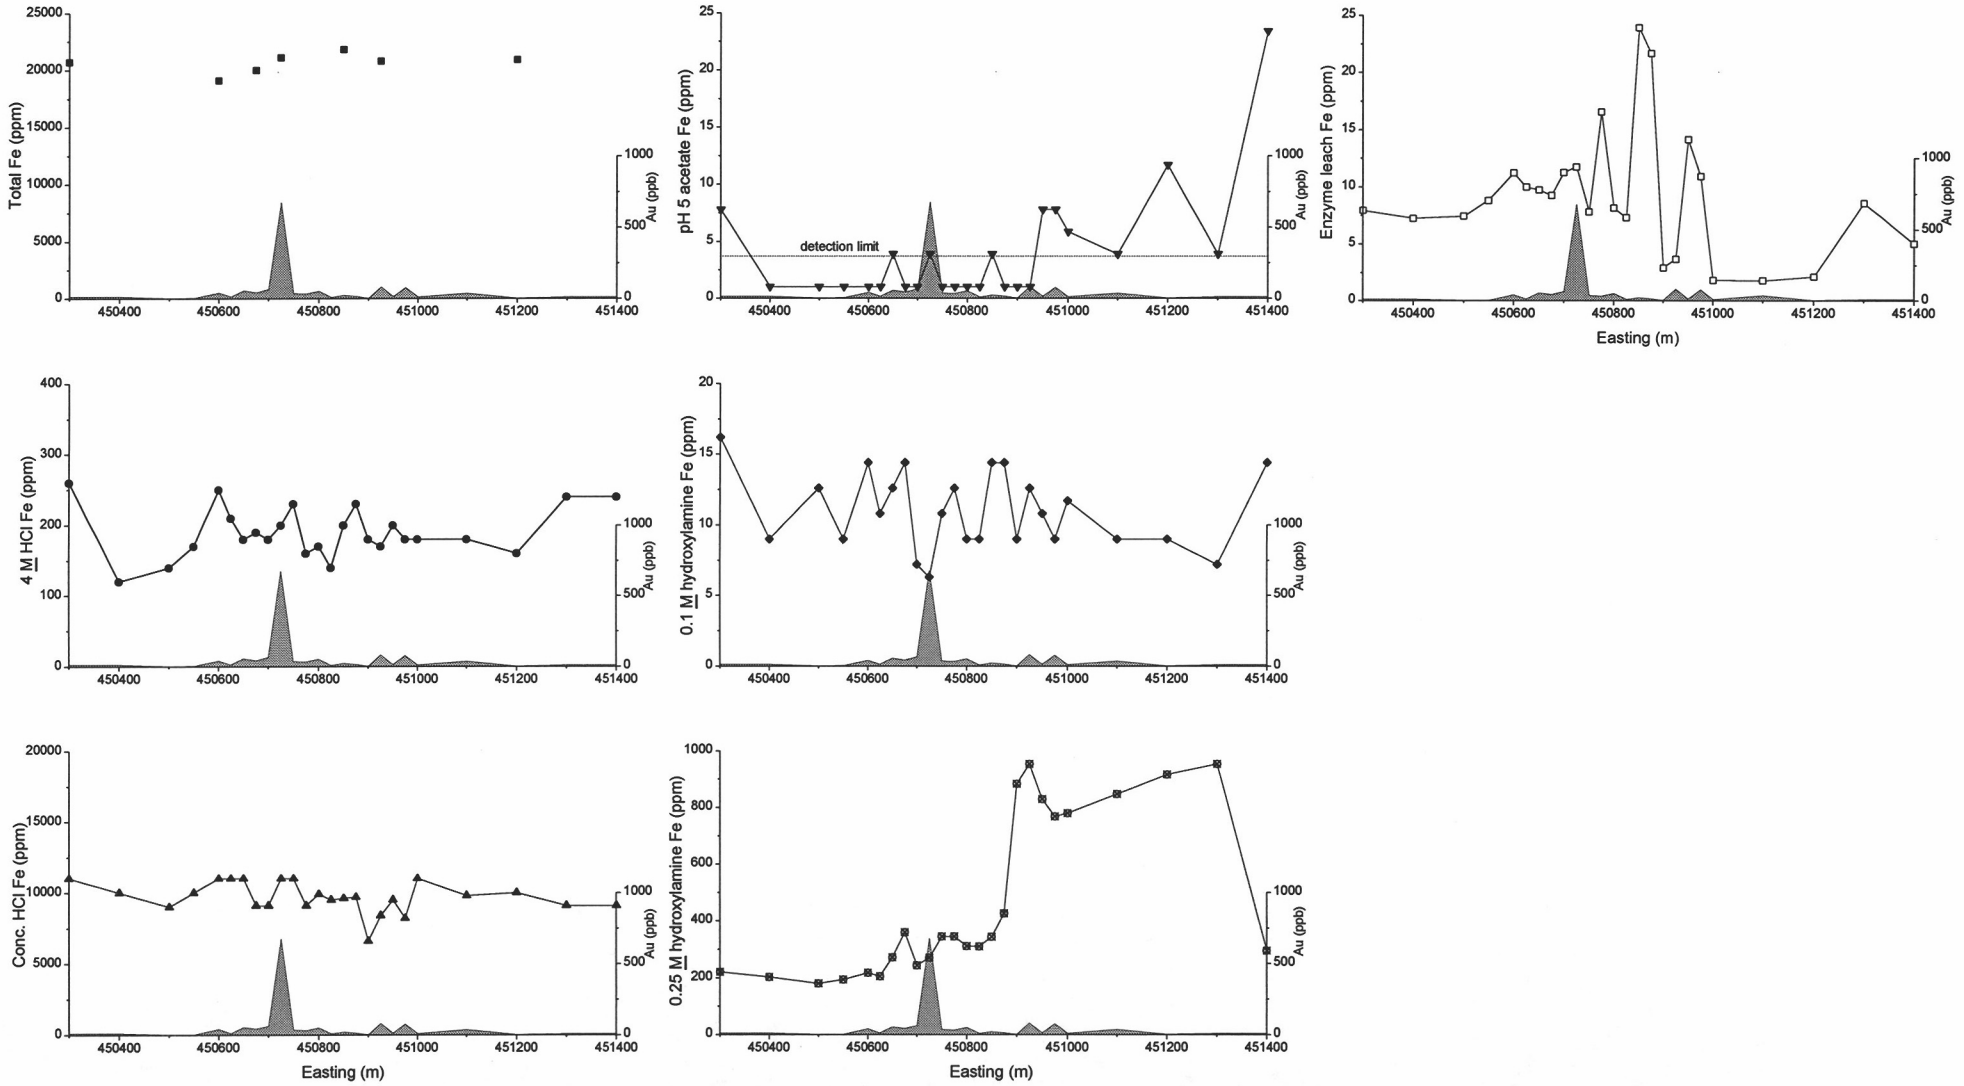

Figure A11.8: Total and extractable Fe from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

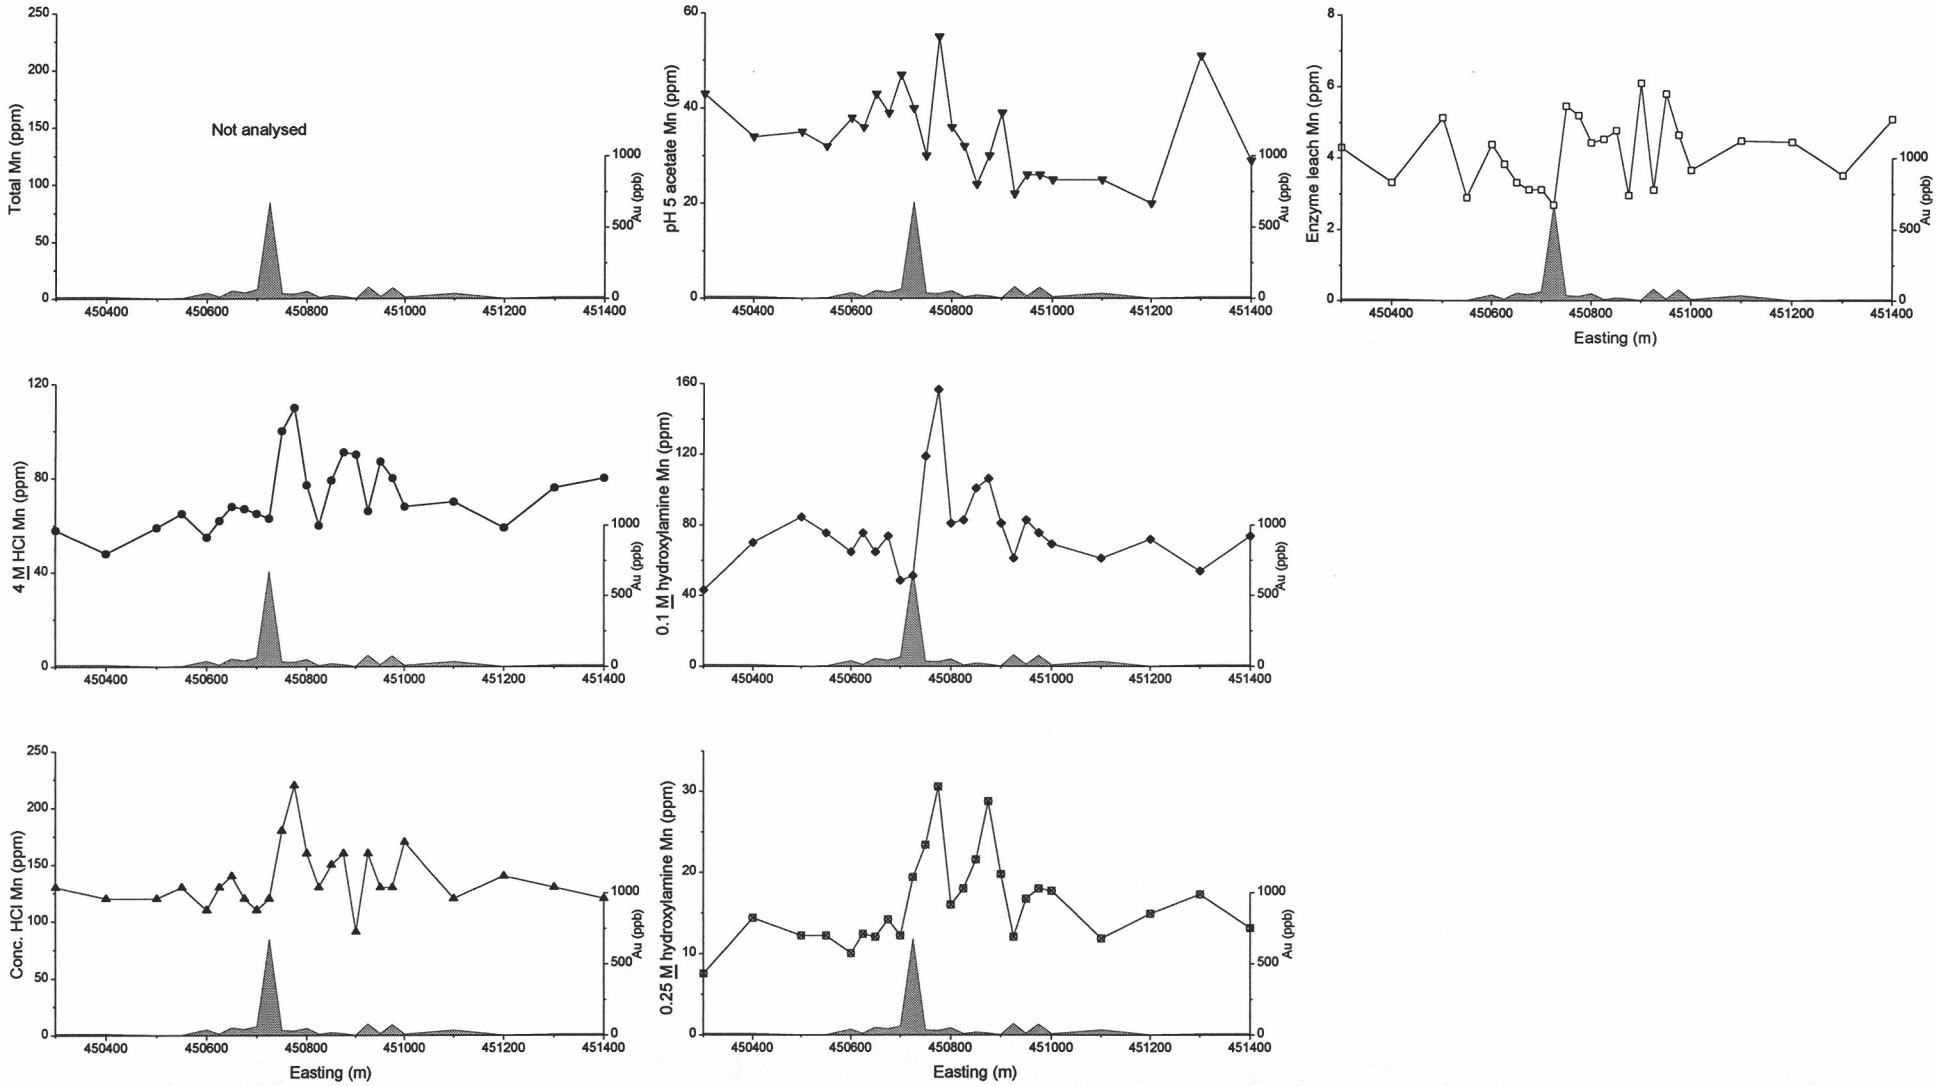

Figure A11.9: Total and extractable Mn from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

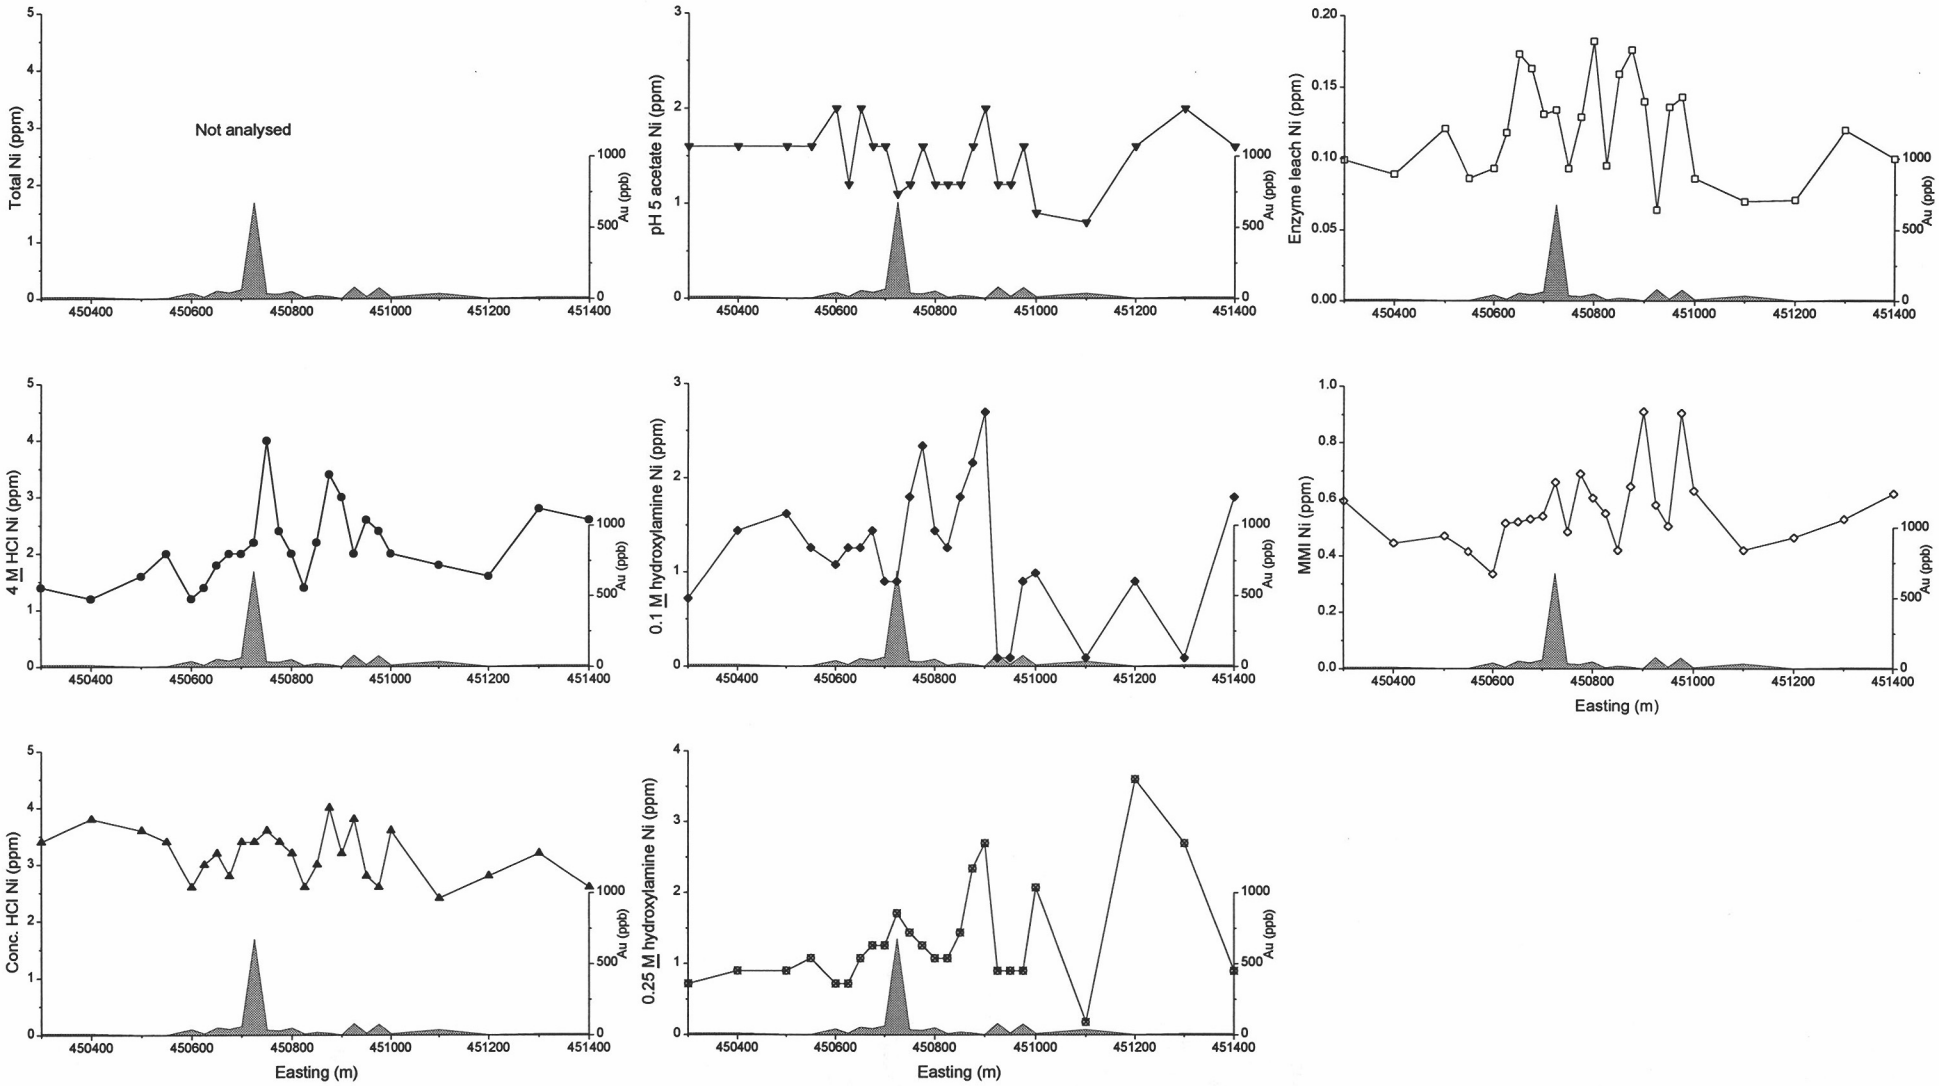

Figure A11.10: Total and extractable Ni from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

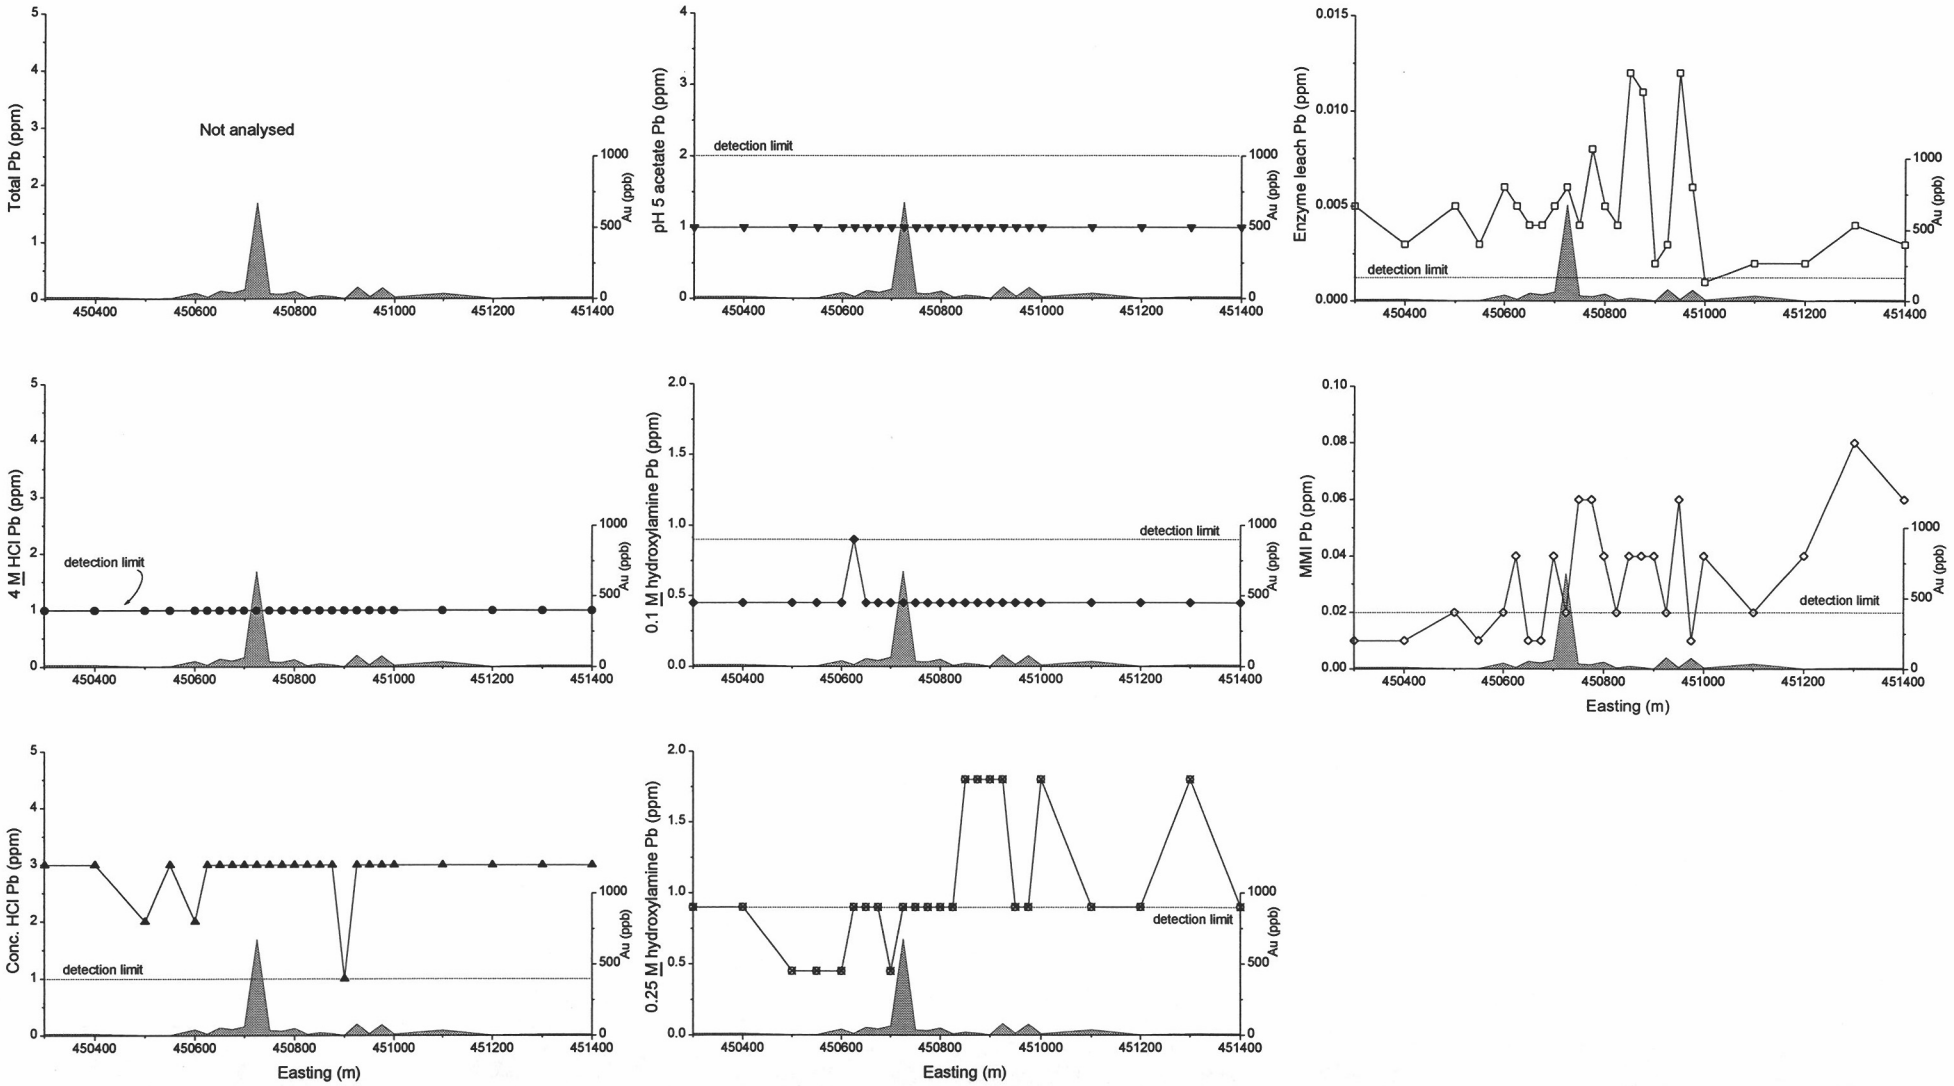

Figure A11.11: Total and extractable Pb from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

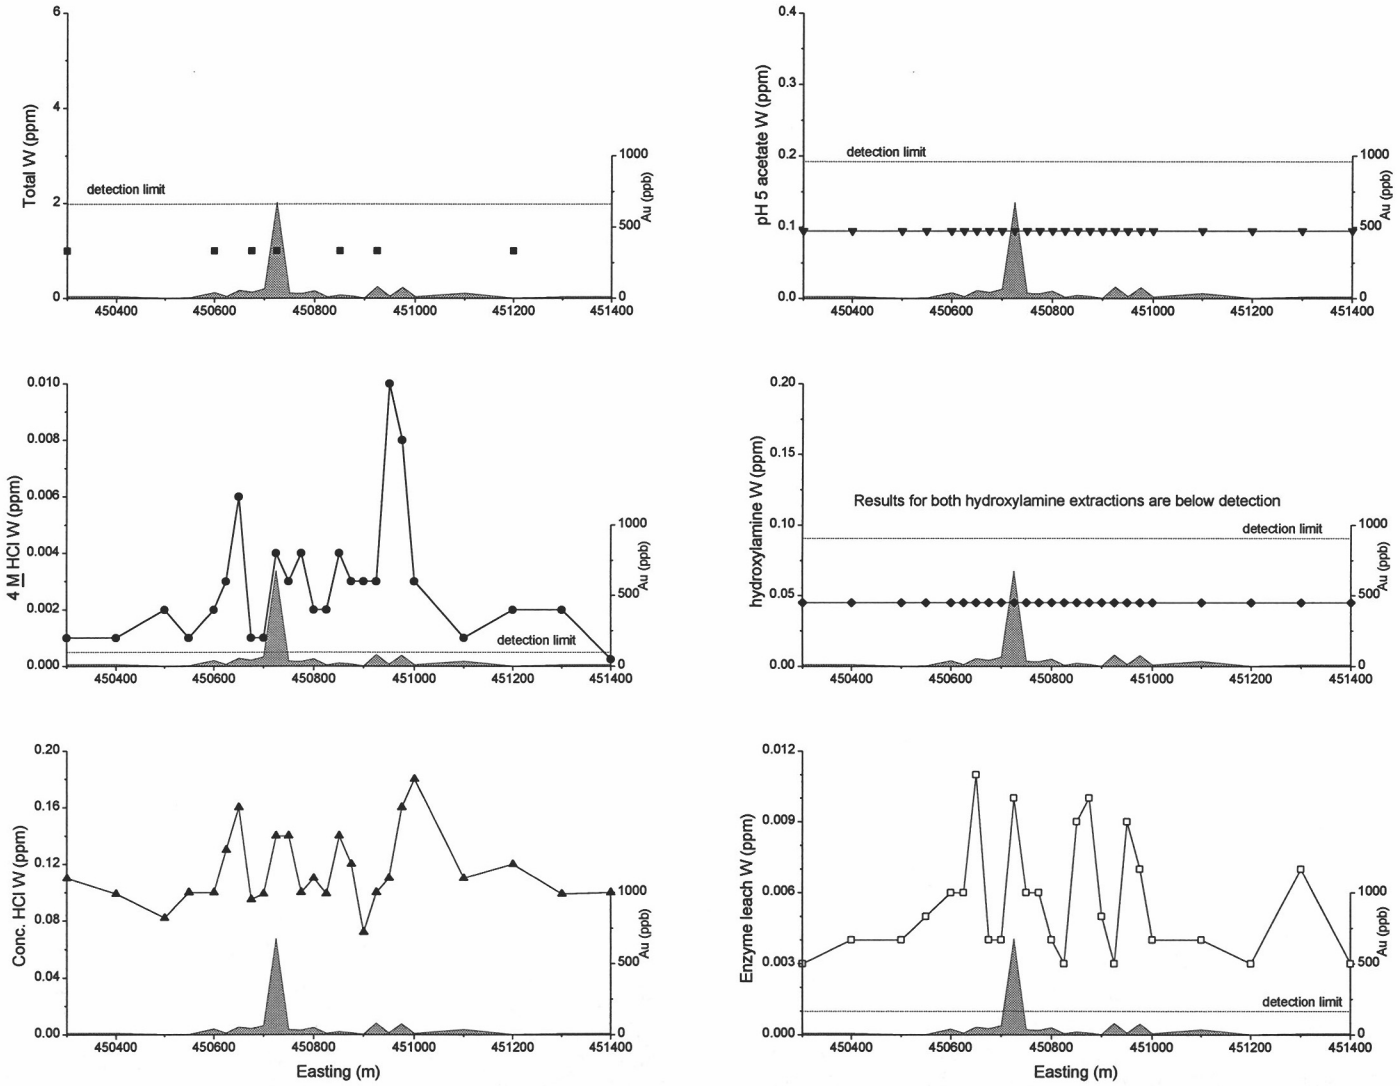

Figure A11.12: Total and extractable W from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

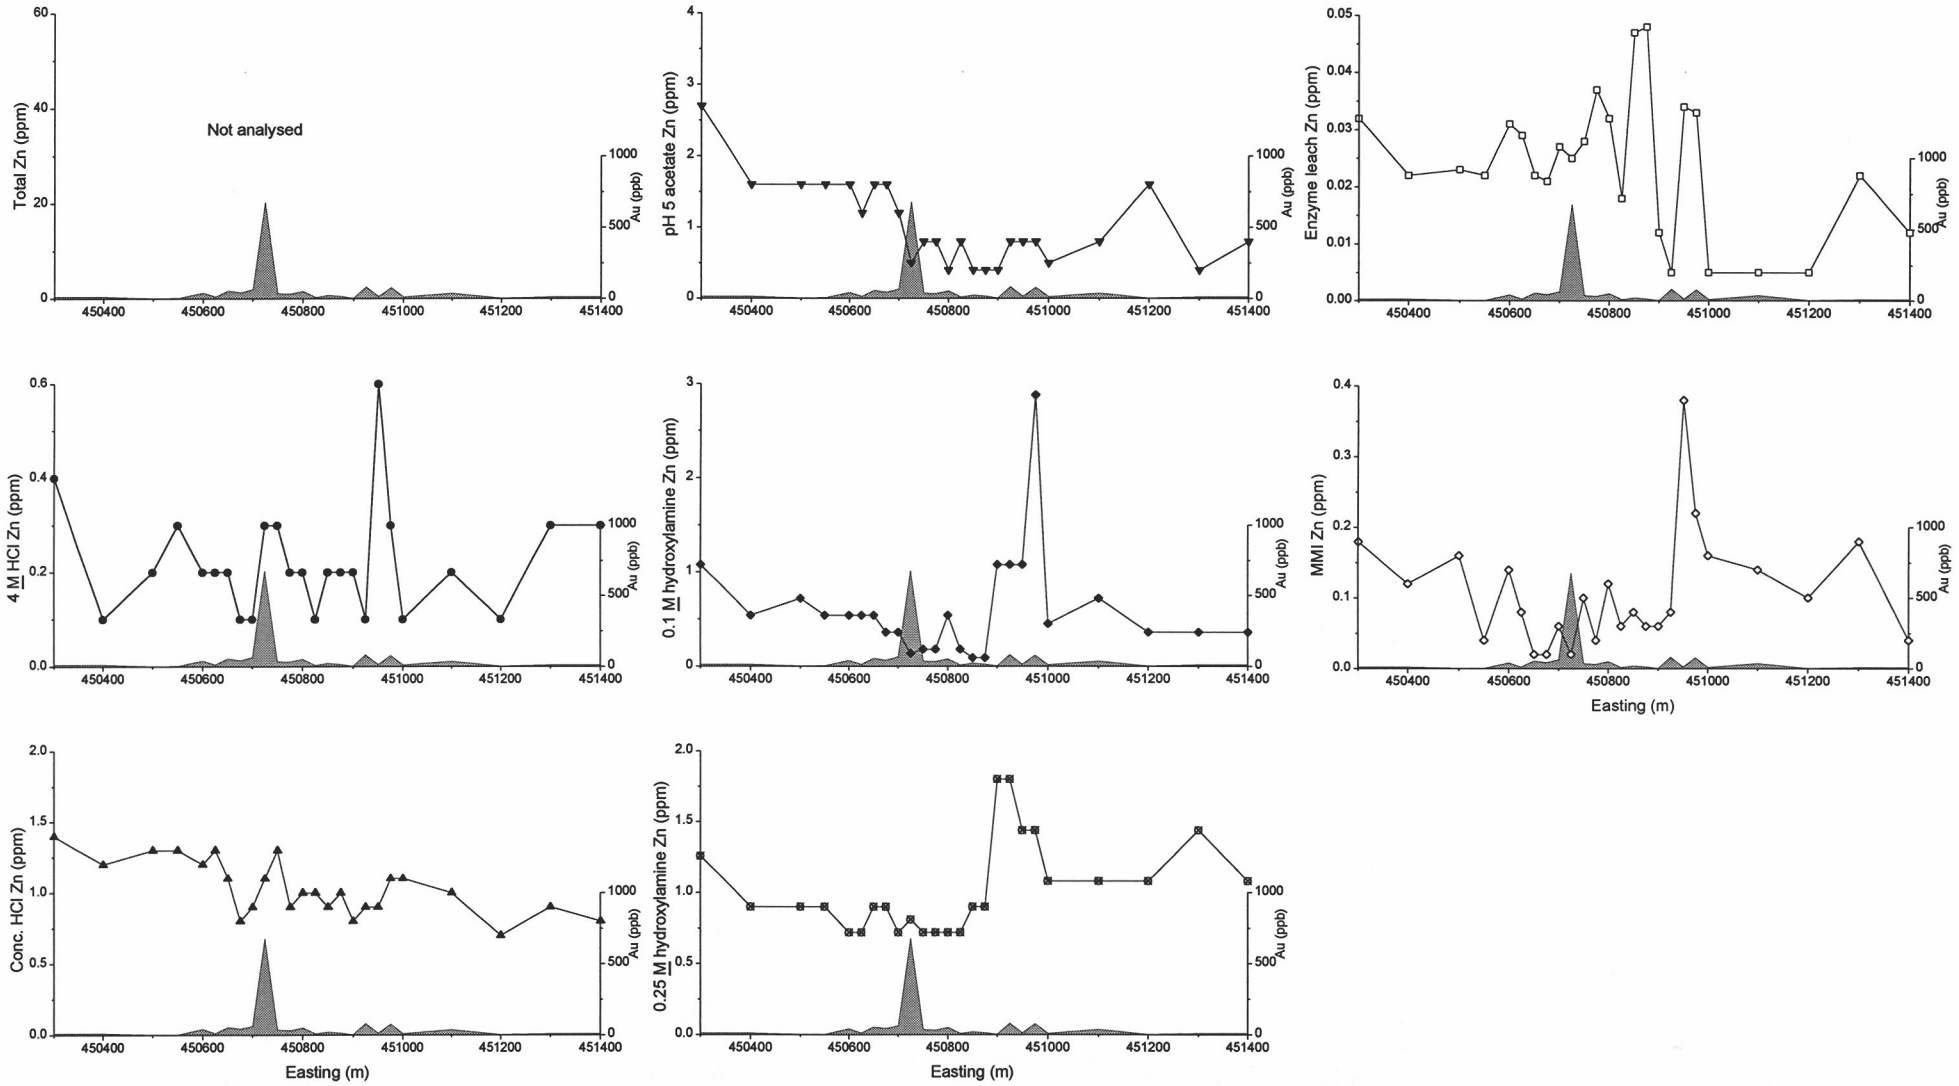

Figure A11.13: Total and extractable Zn from Safari line 6732300N.
(Shaded area represents highest determined Au content in top 3 m of Archaean).

Appendix 12: Traverse Data for Steinway

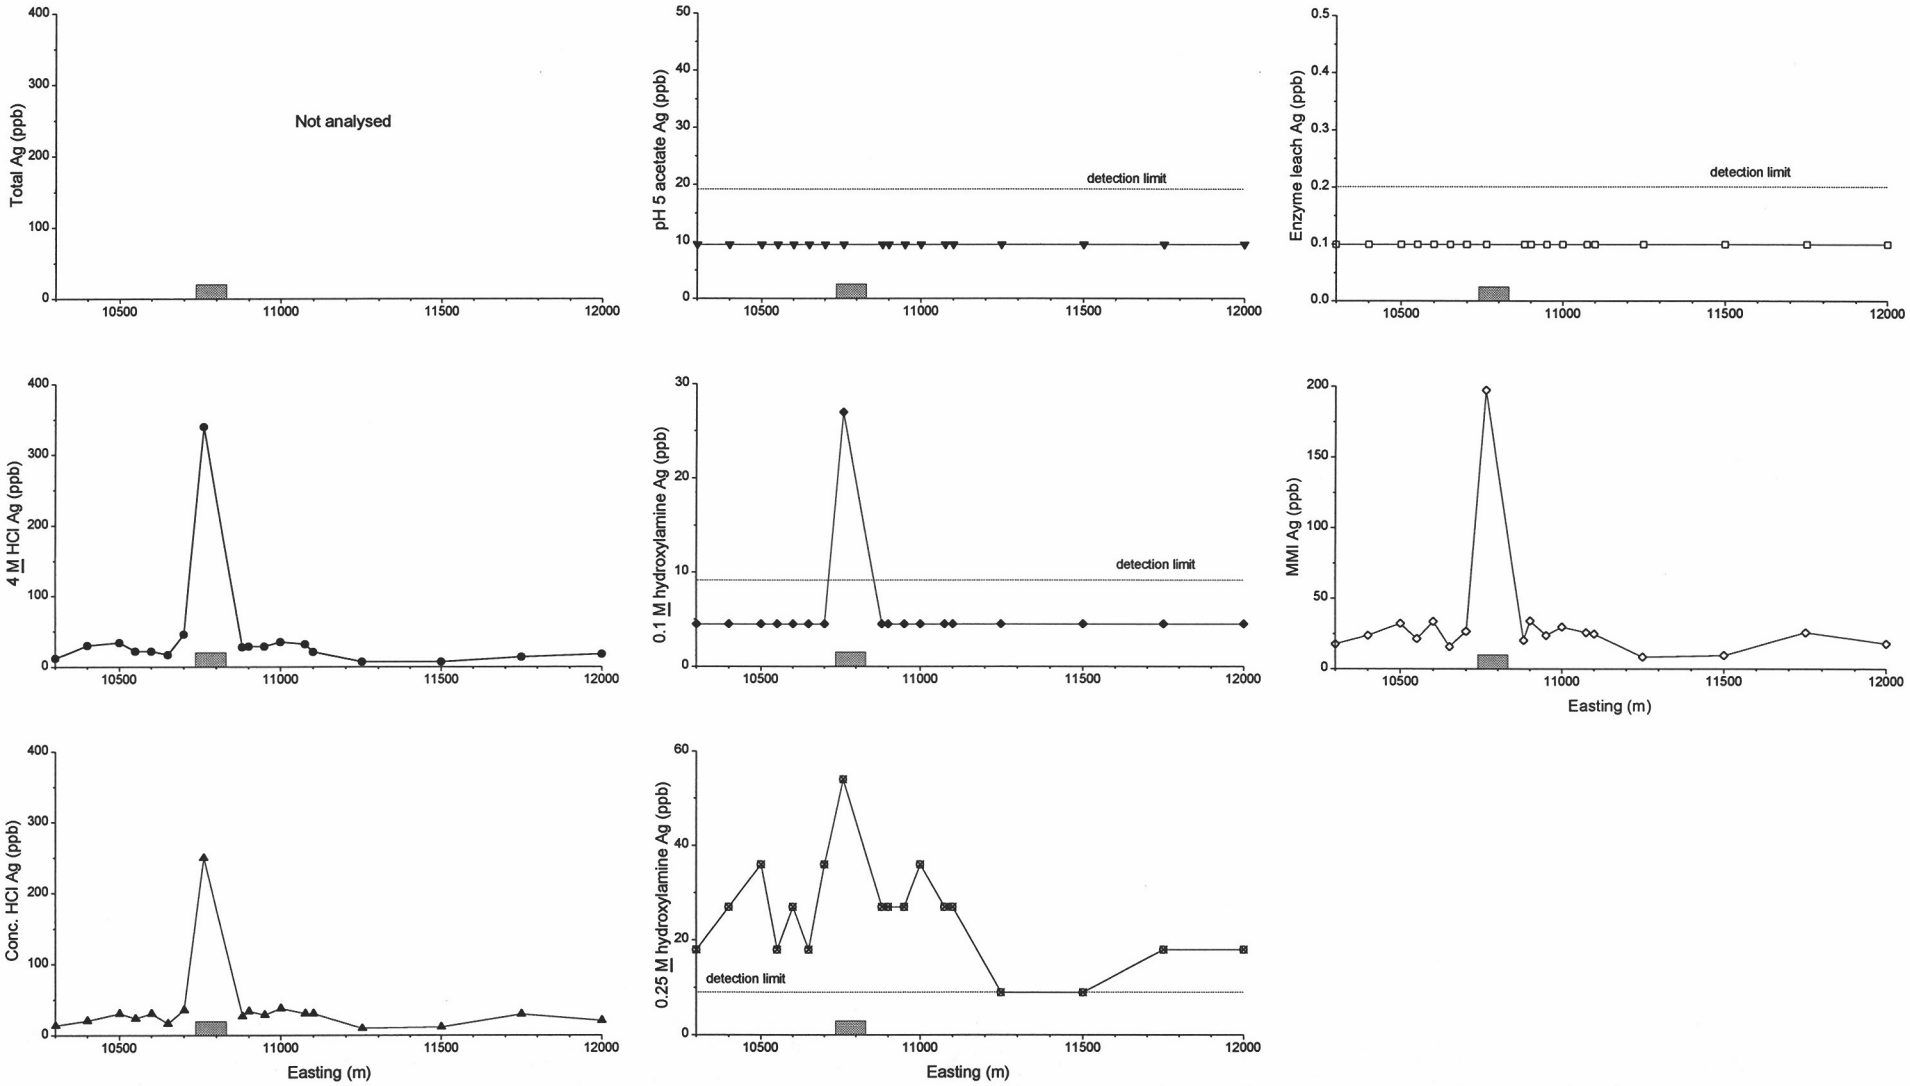

Figure A12.1: Total and extractable Ag from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

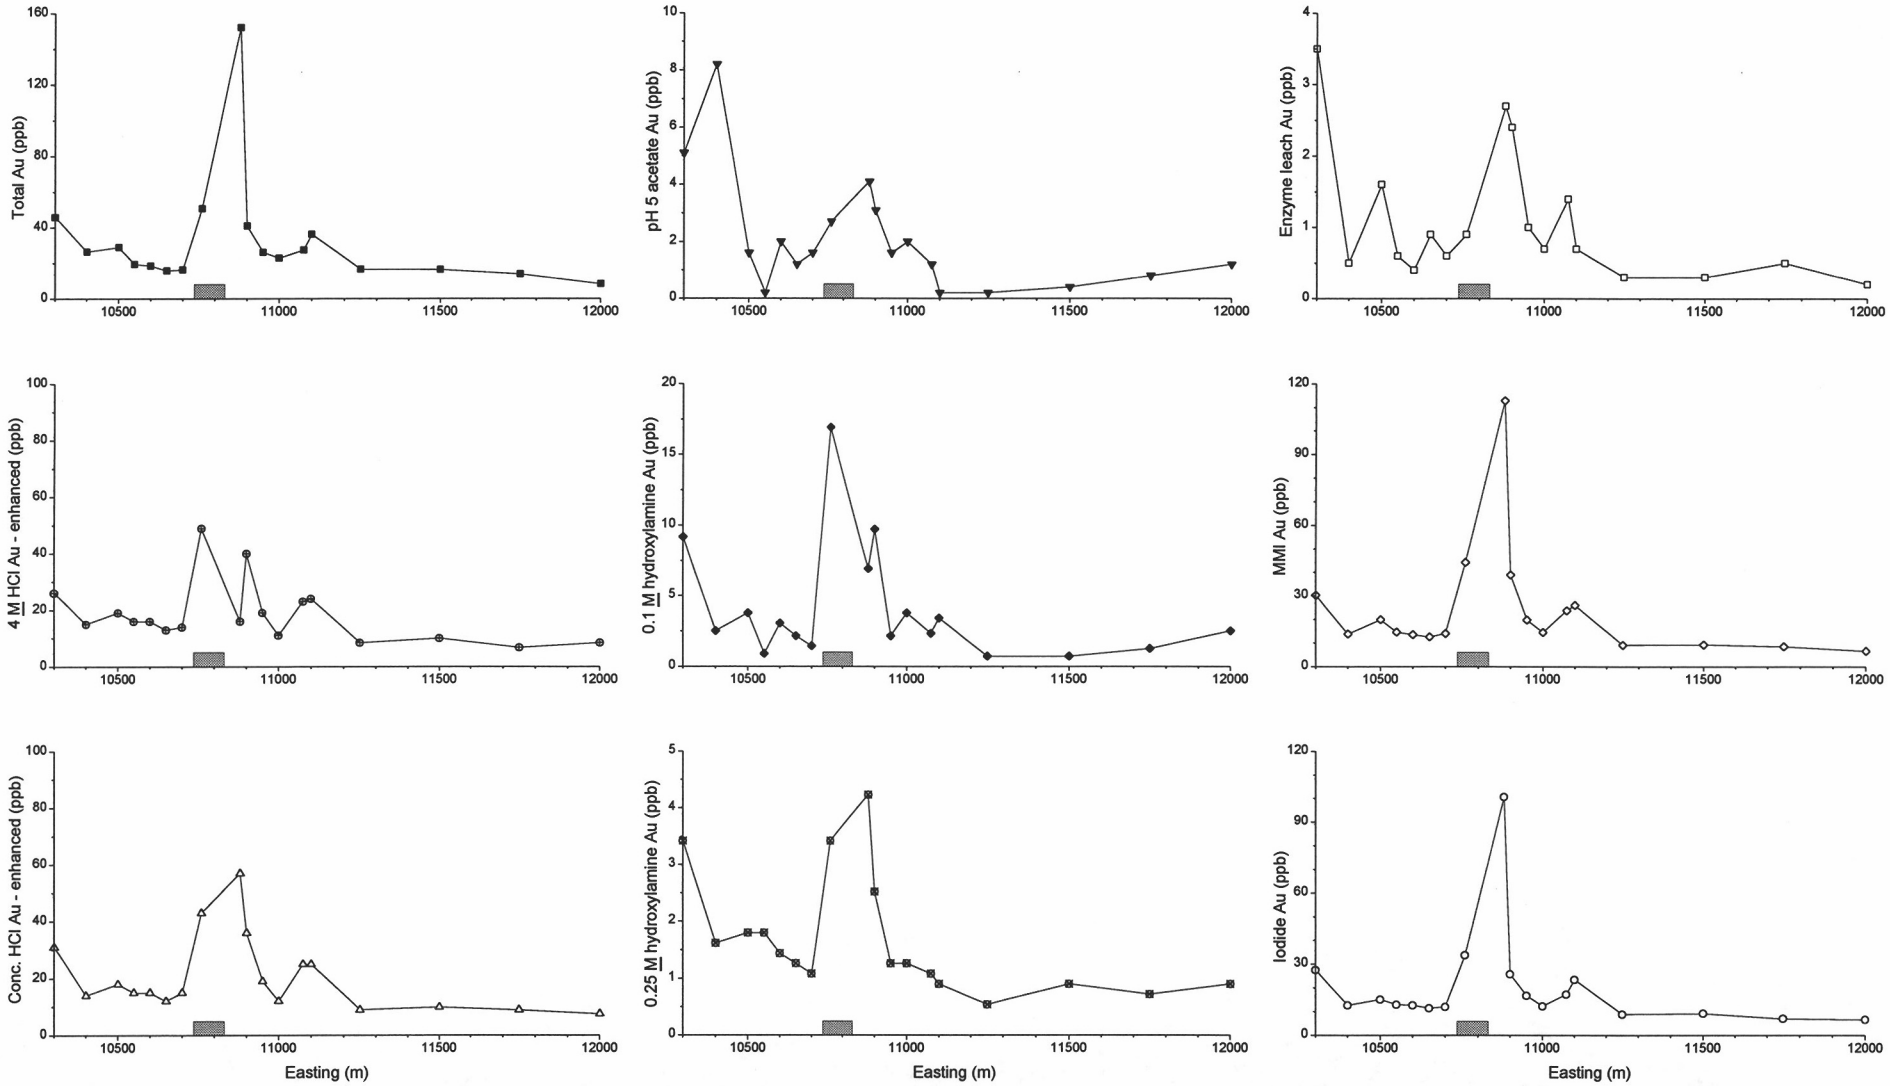

Figure A12.2: Total and extractable Au from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

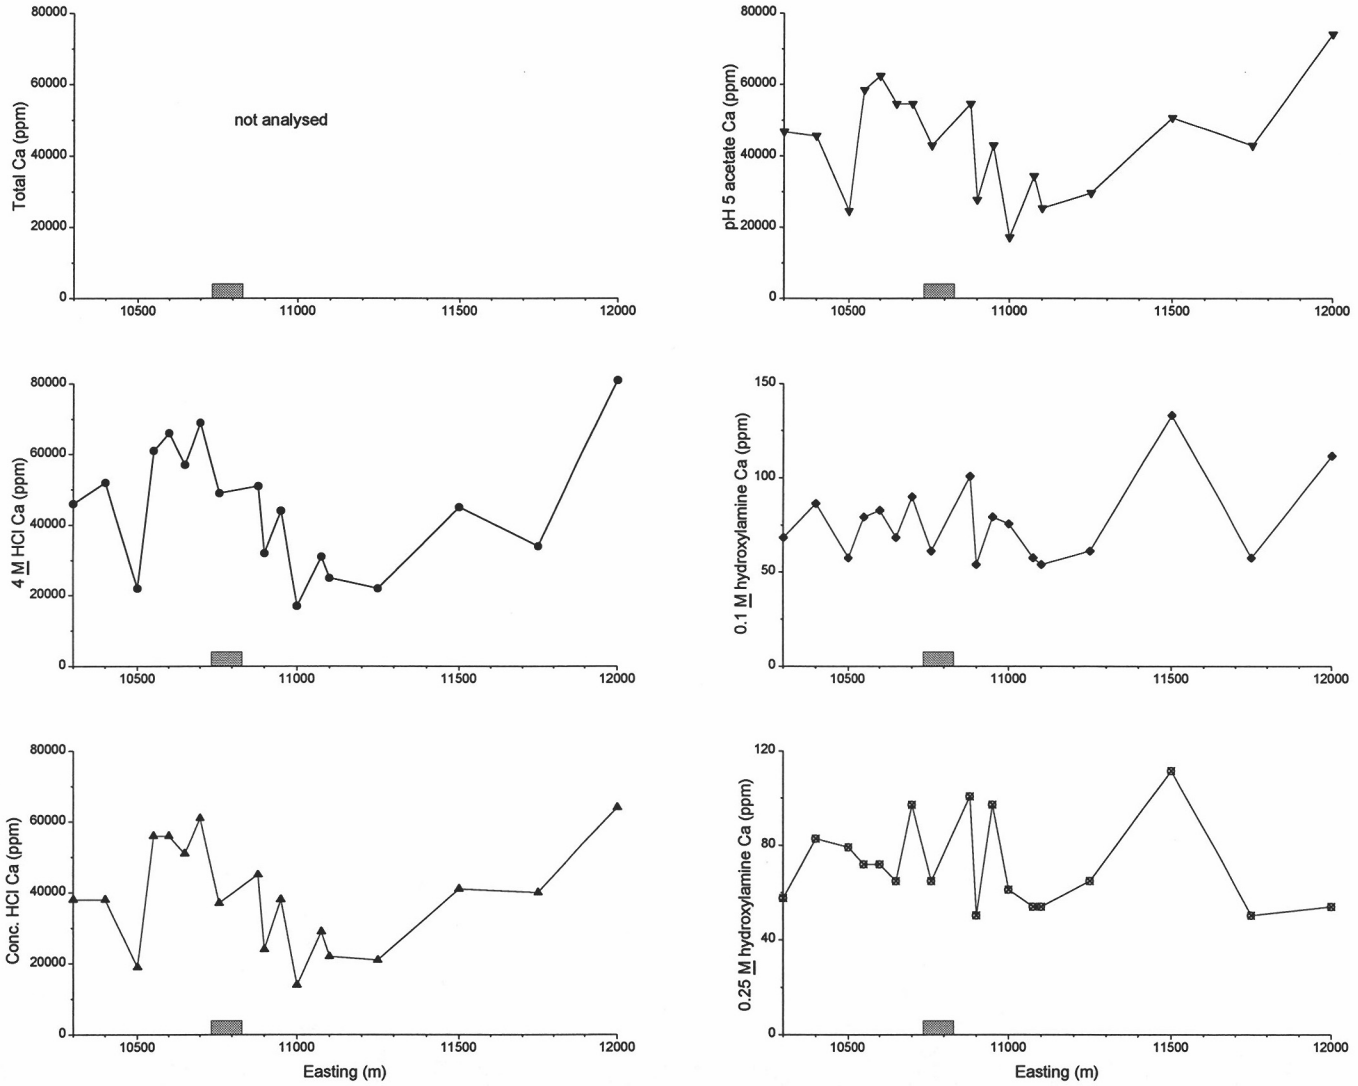

Figure A12.3: Total and extractable Ca from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

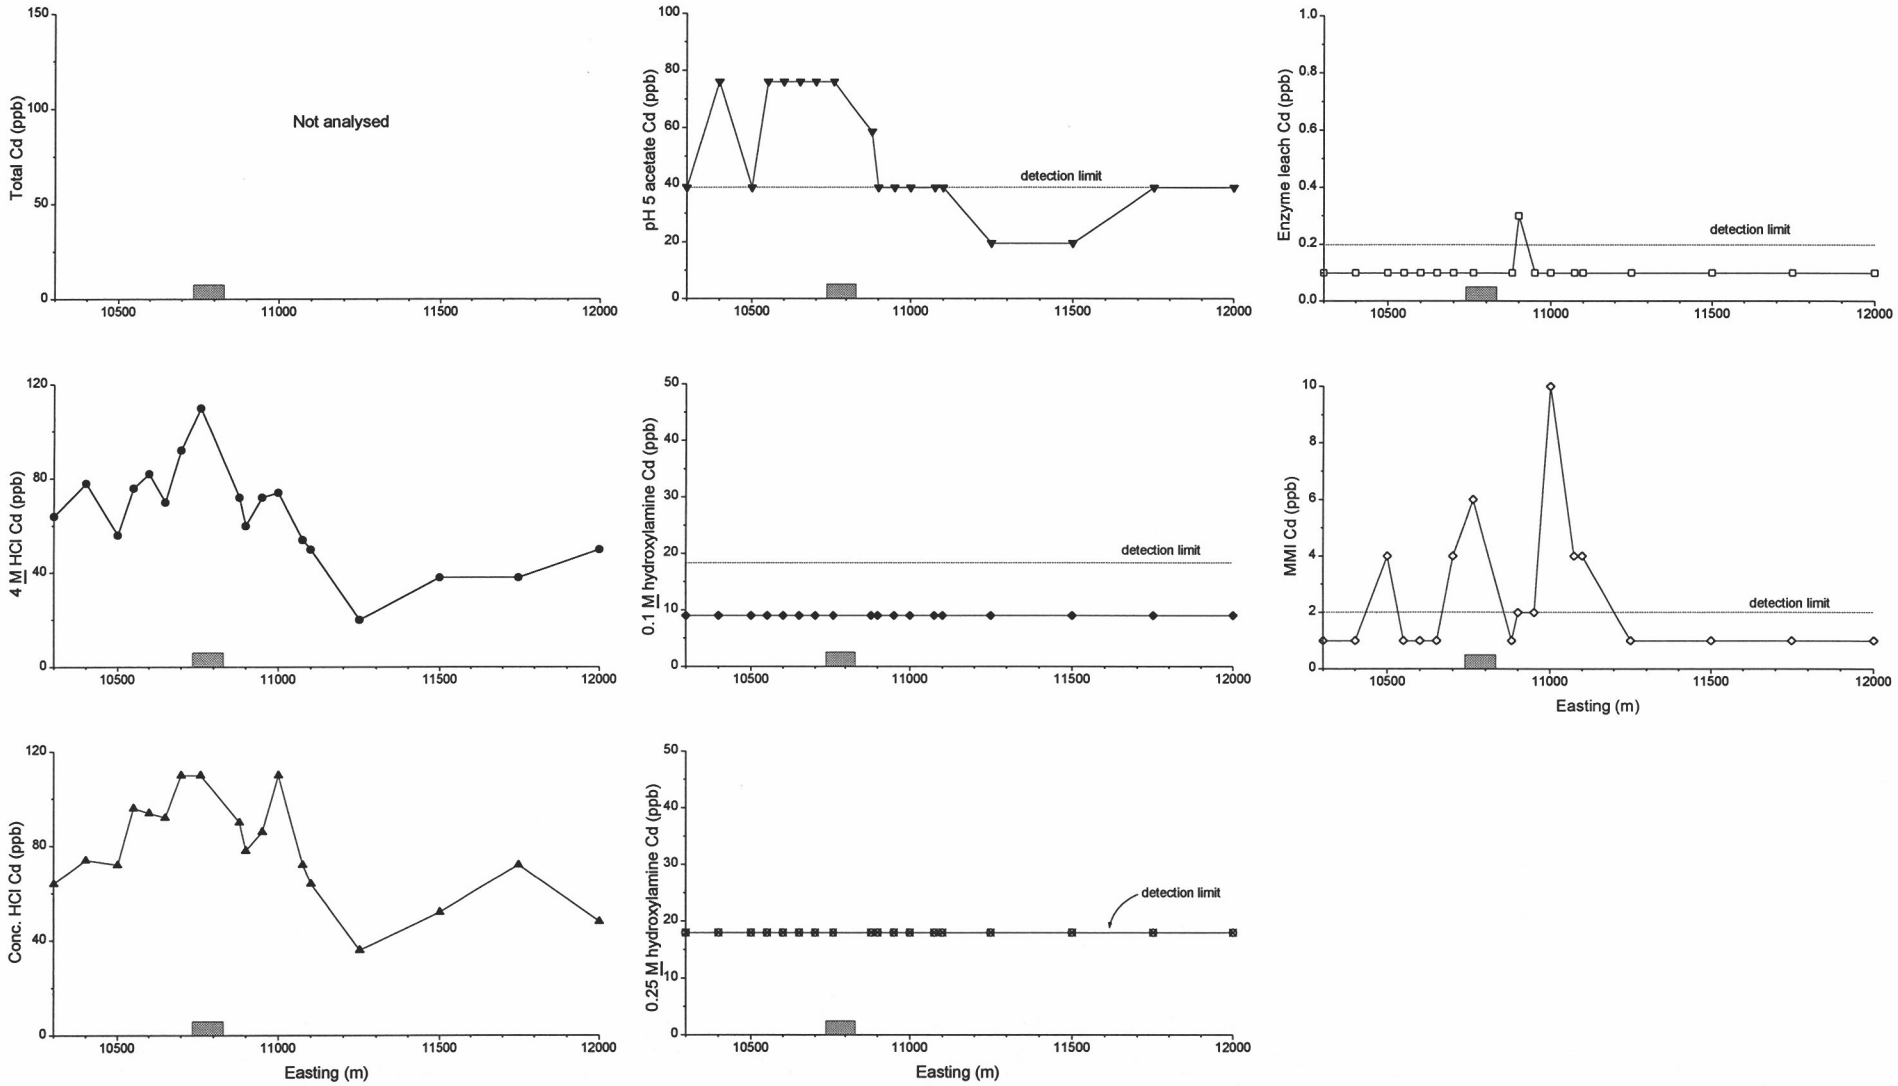

Figure A12.4: Total and extractable Cd from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

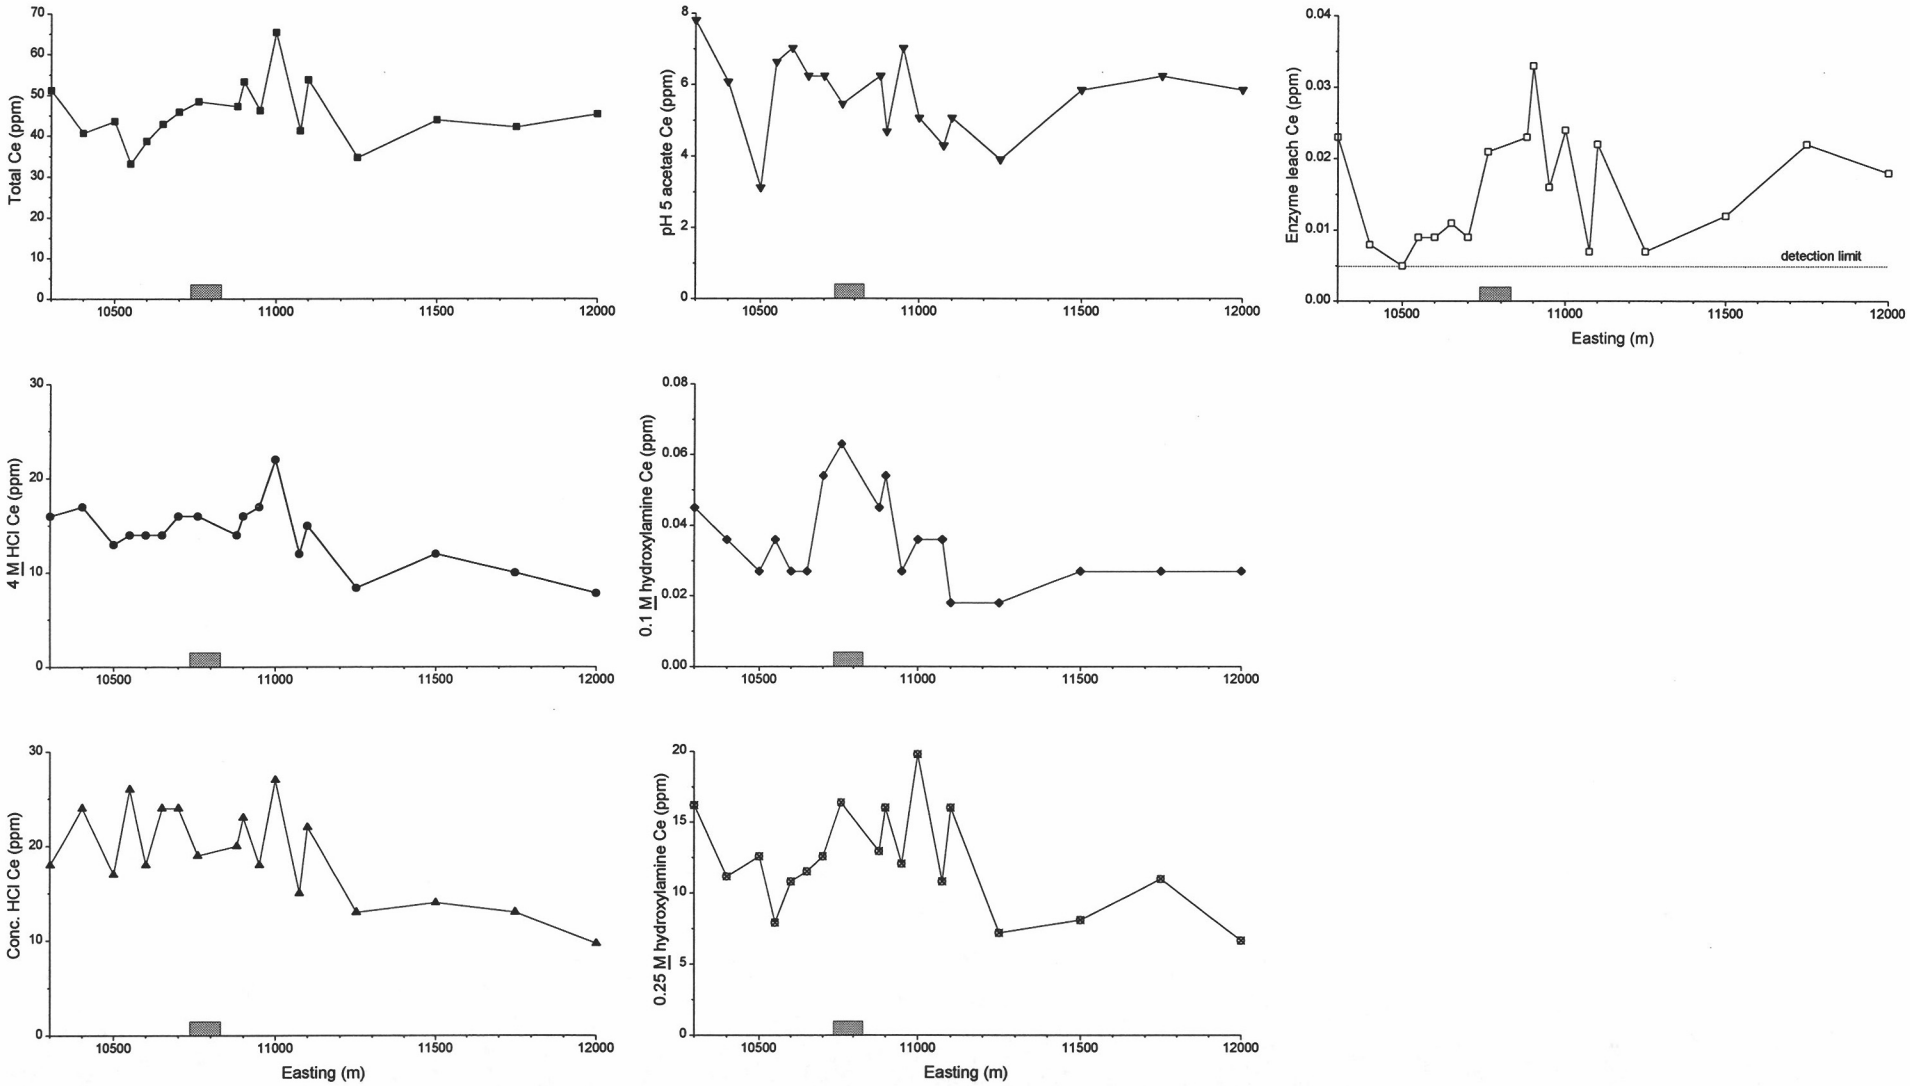

Figure A12.5: Total and extractable Ce from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

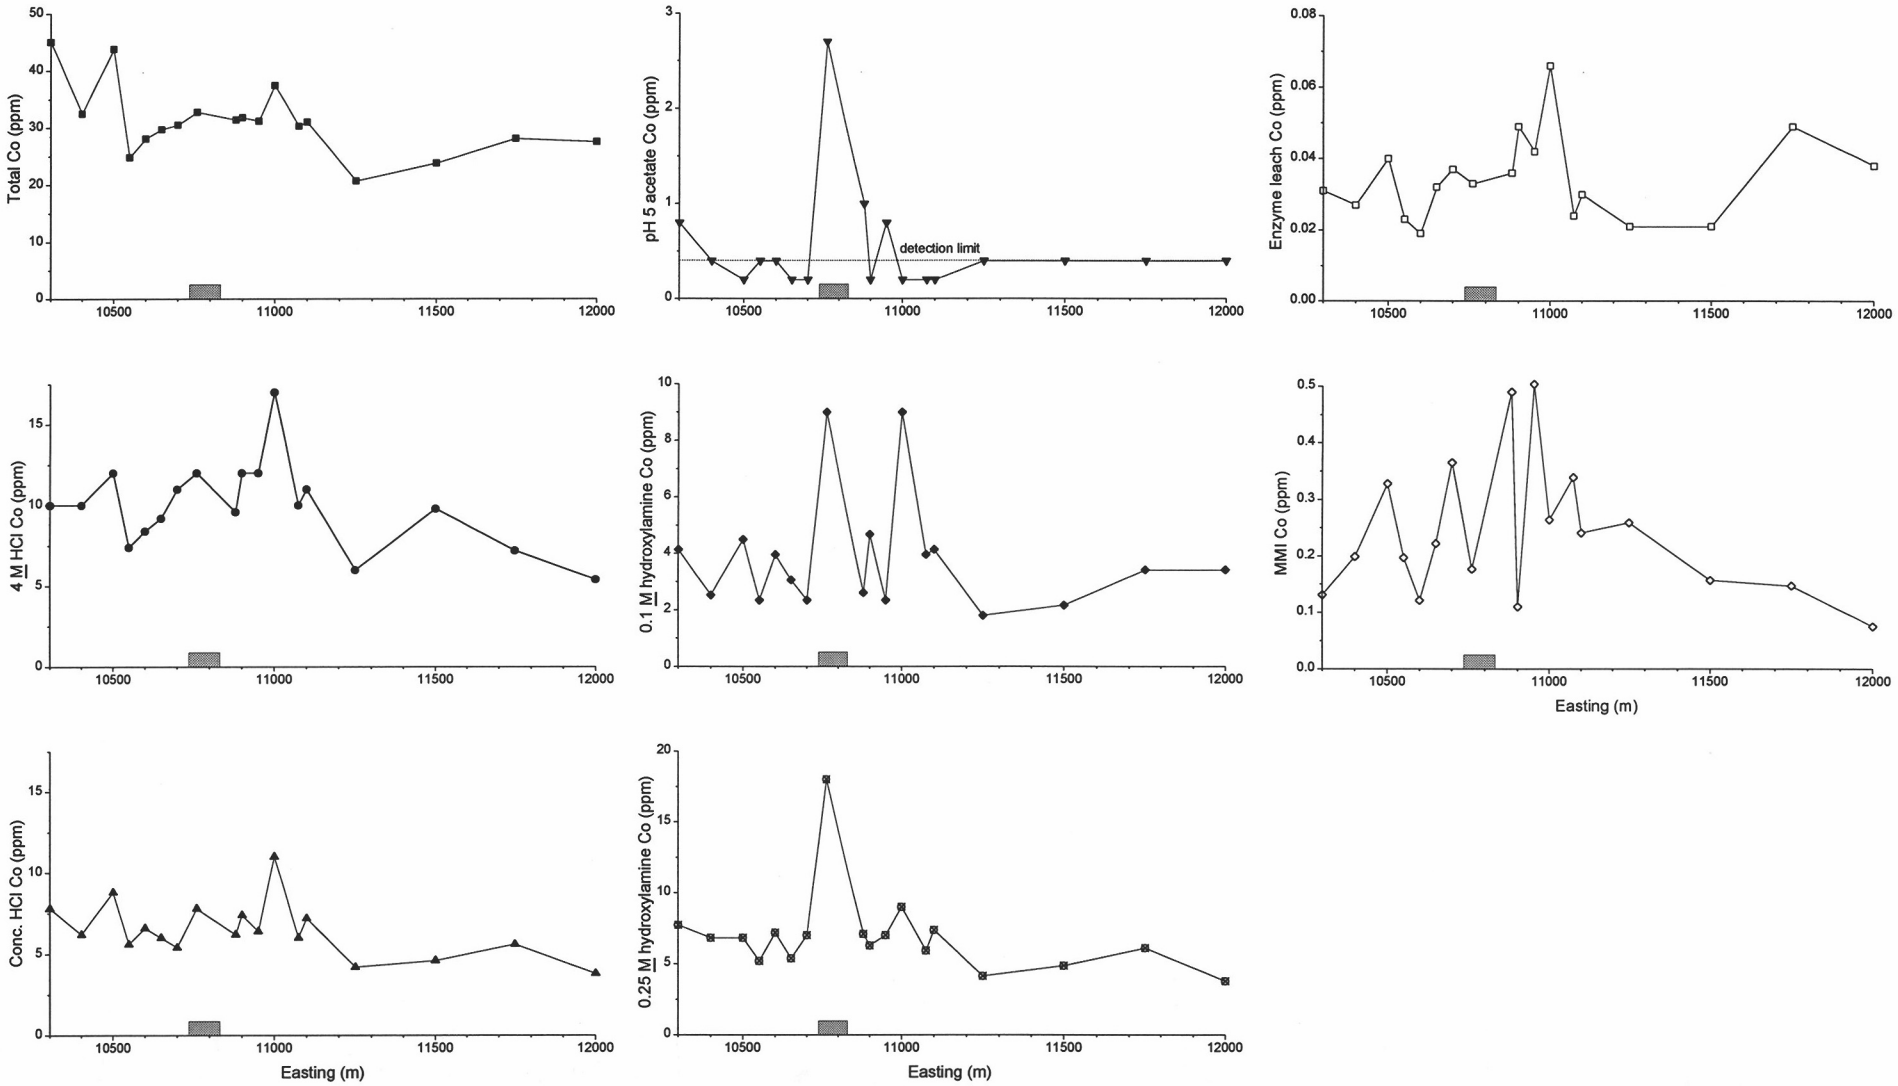

Figure A12.6: Total and extractable Co from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

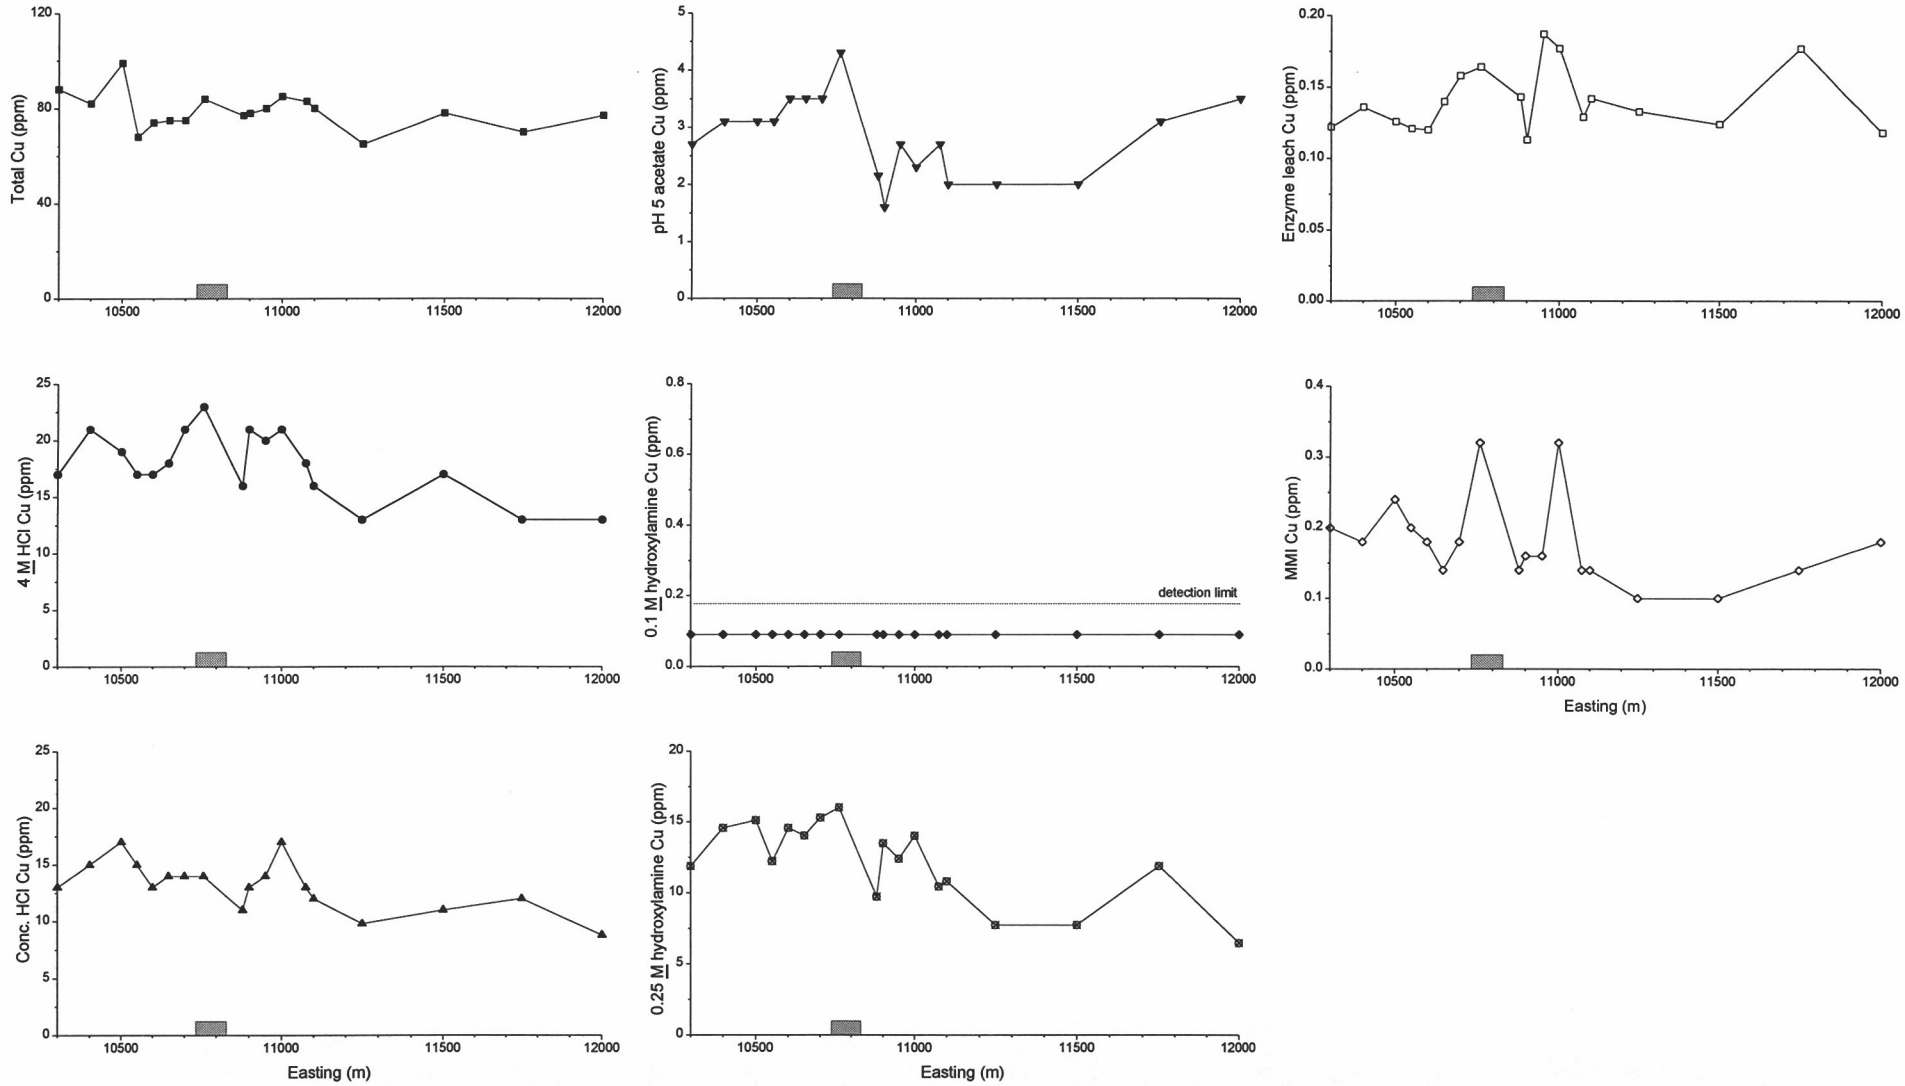

Figure A12.7: Total and extractable Cu from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

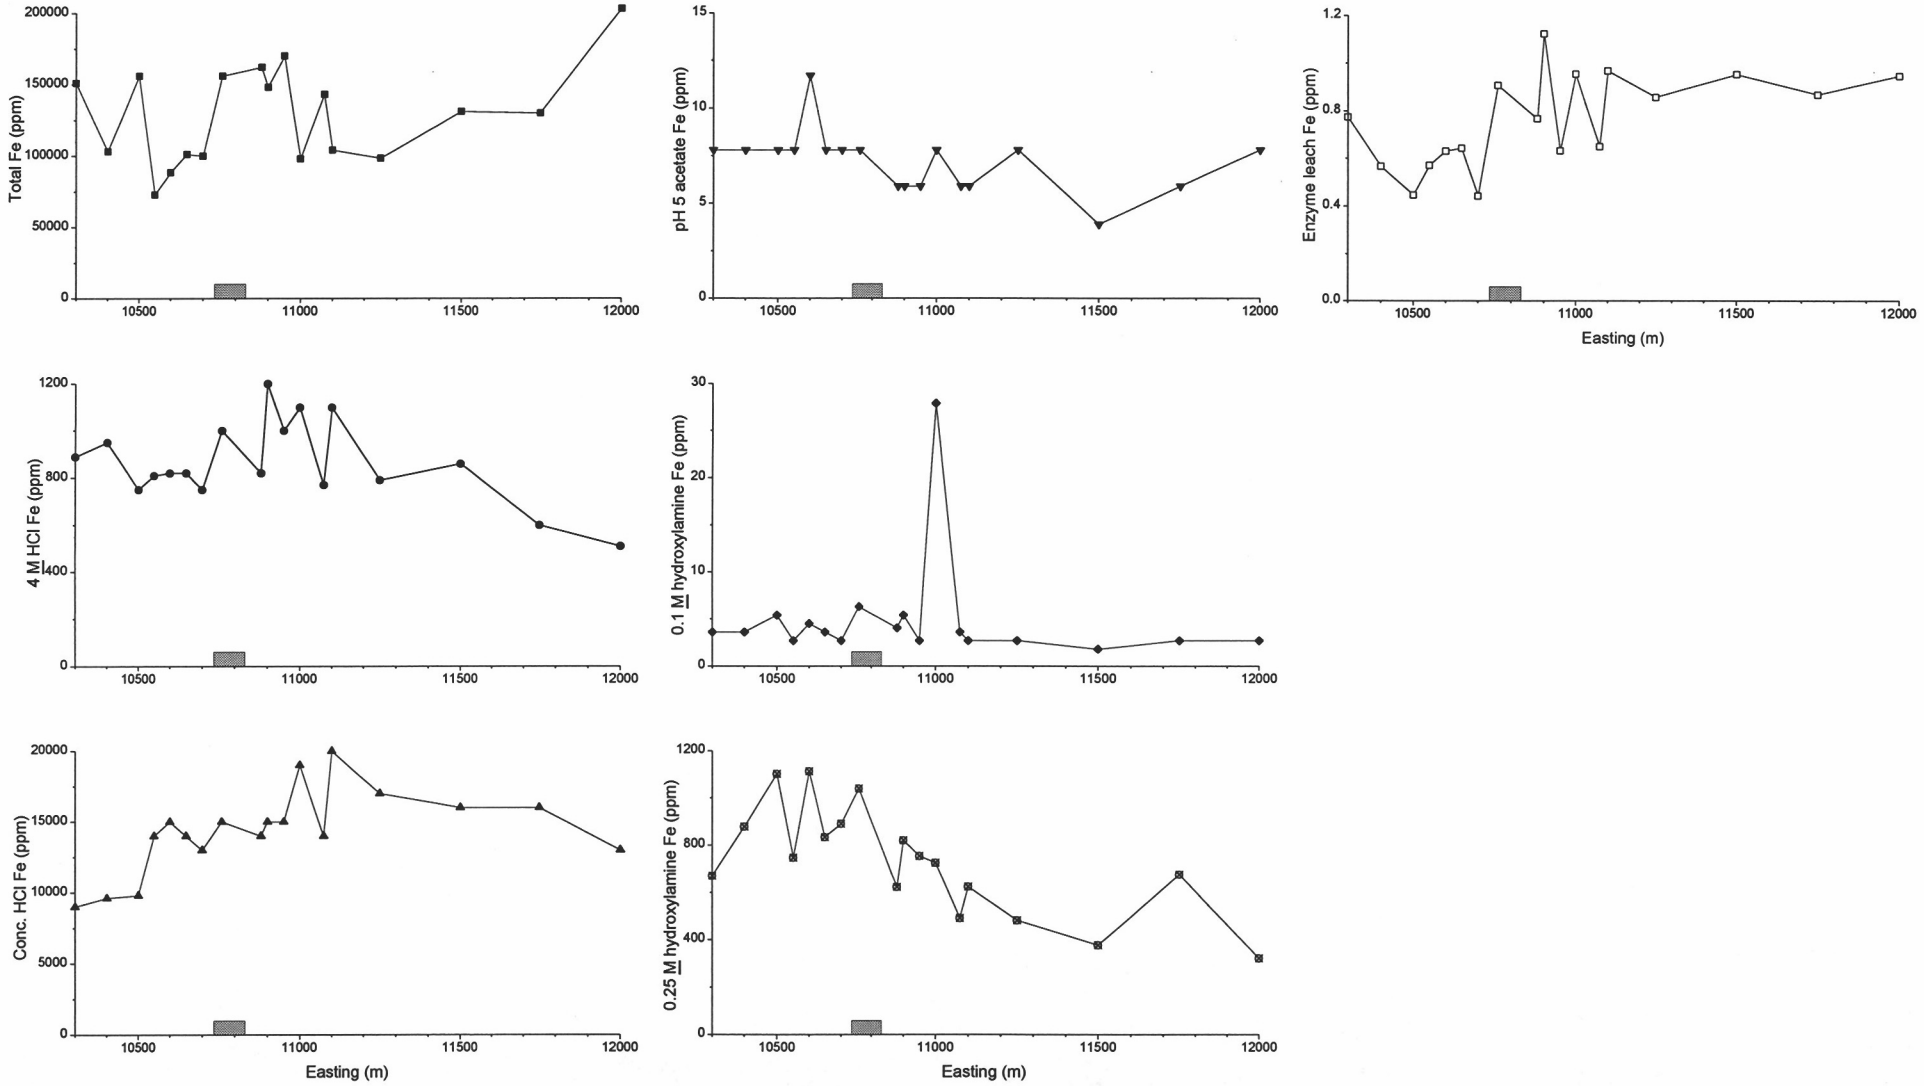

Figure A12.8: Total and extractable Fe from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

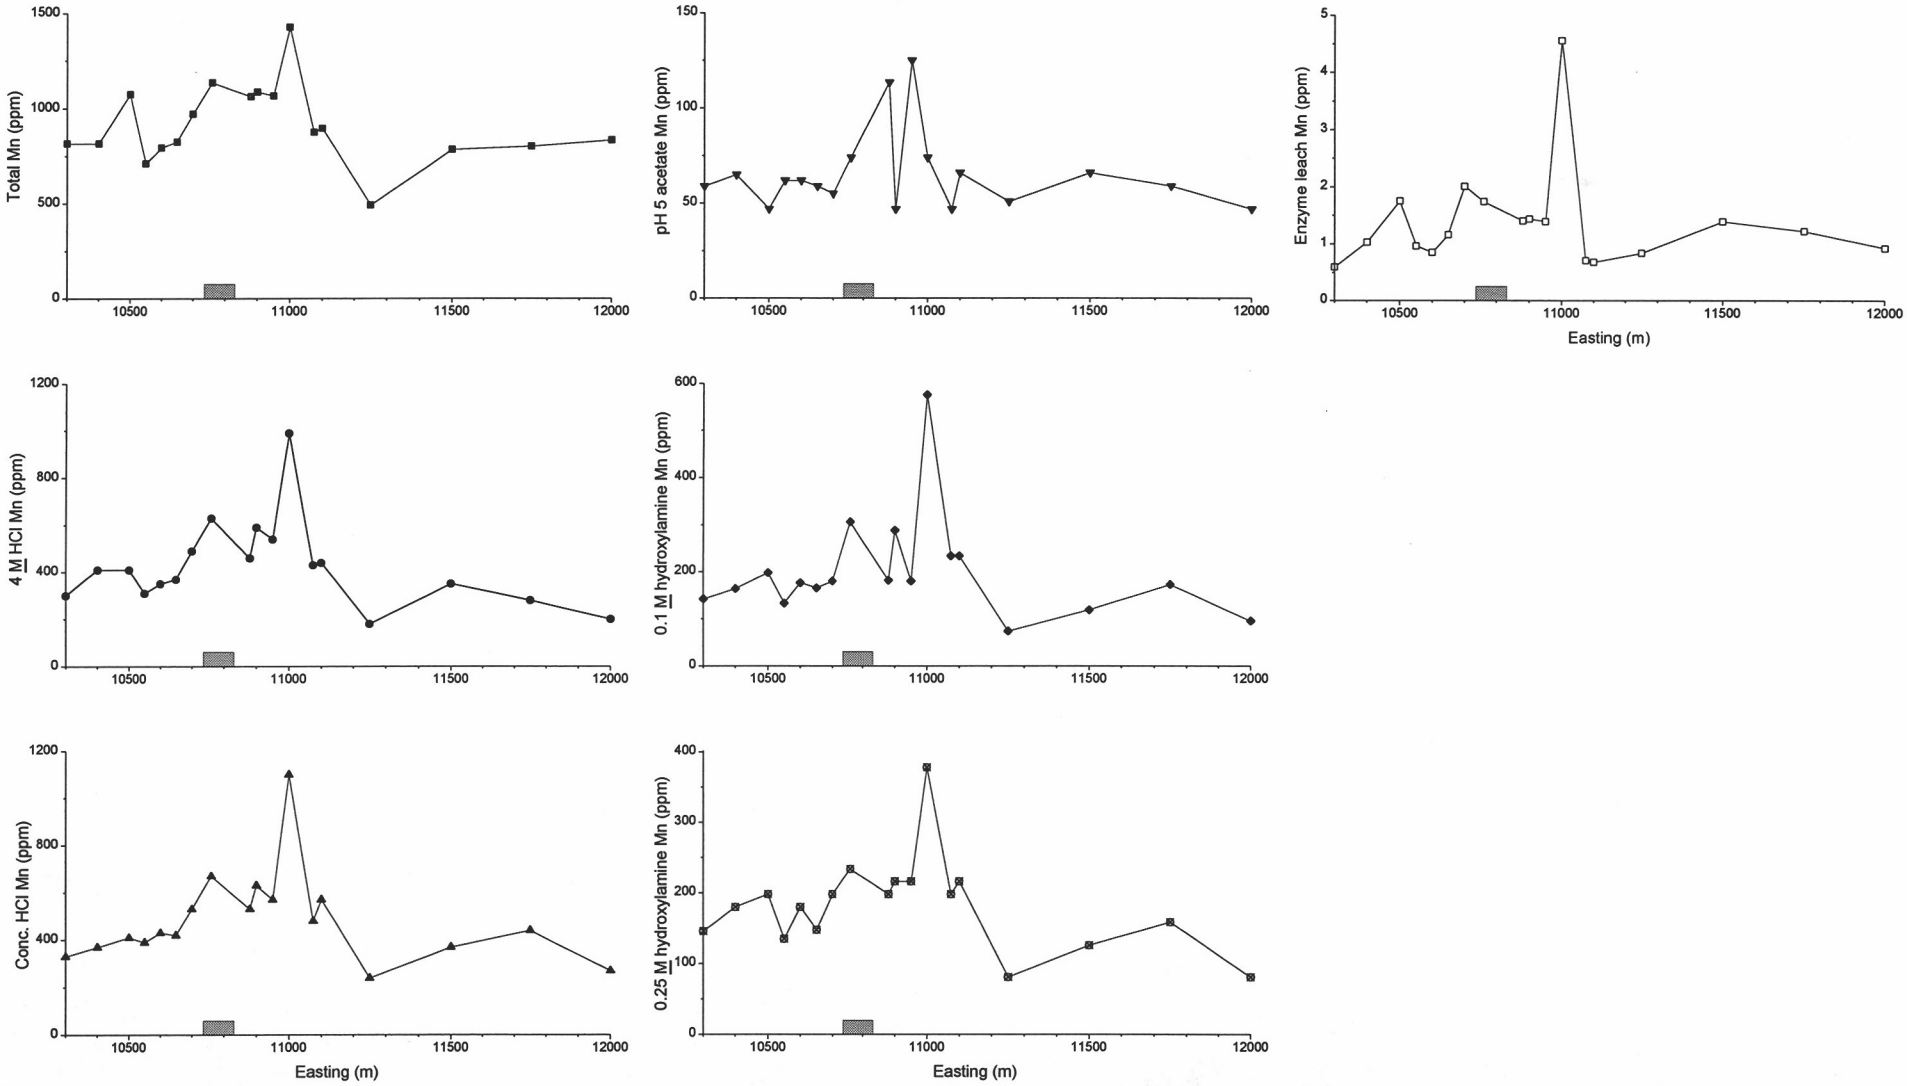

Figure A12.9: Total and extractable Mn from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

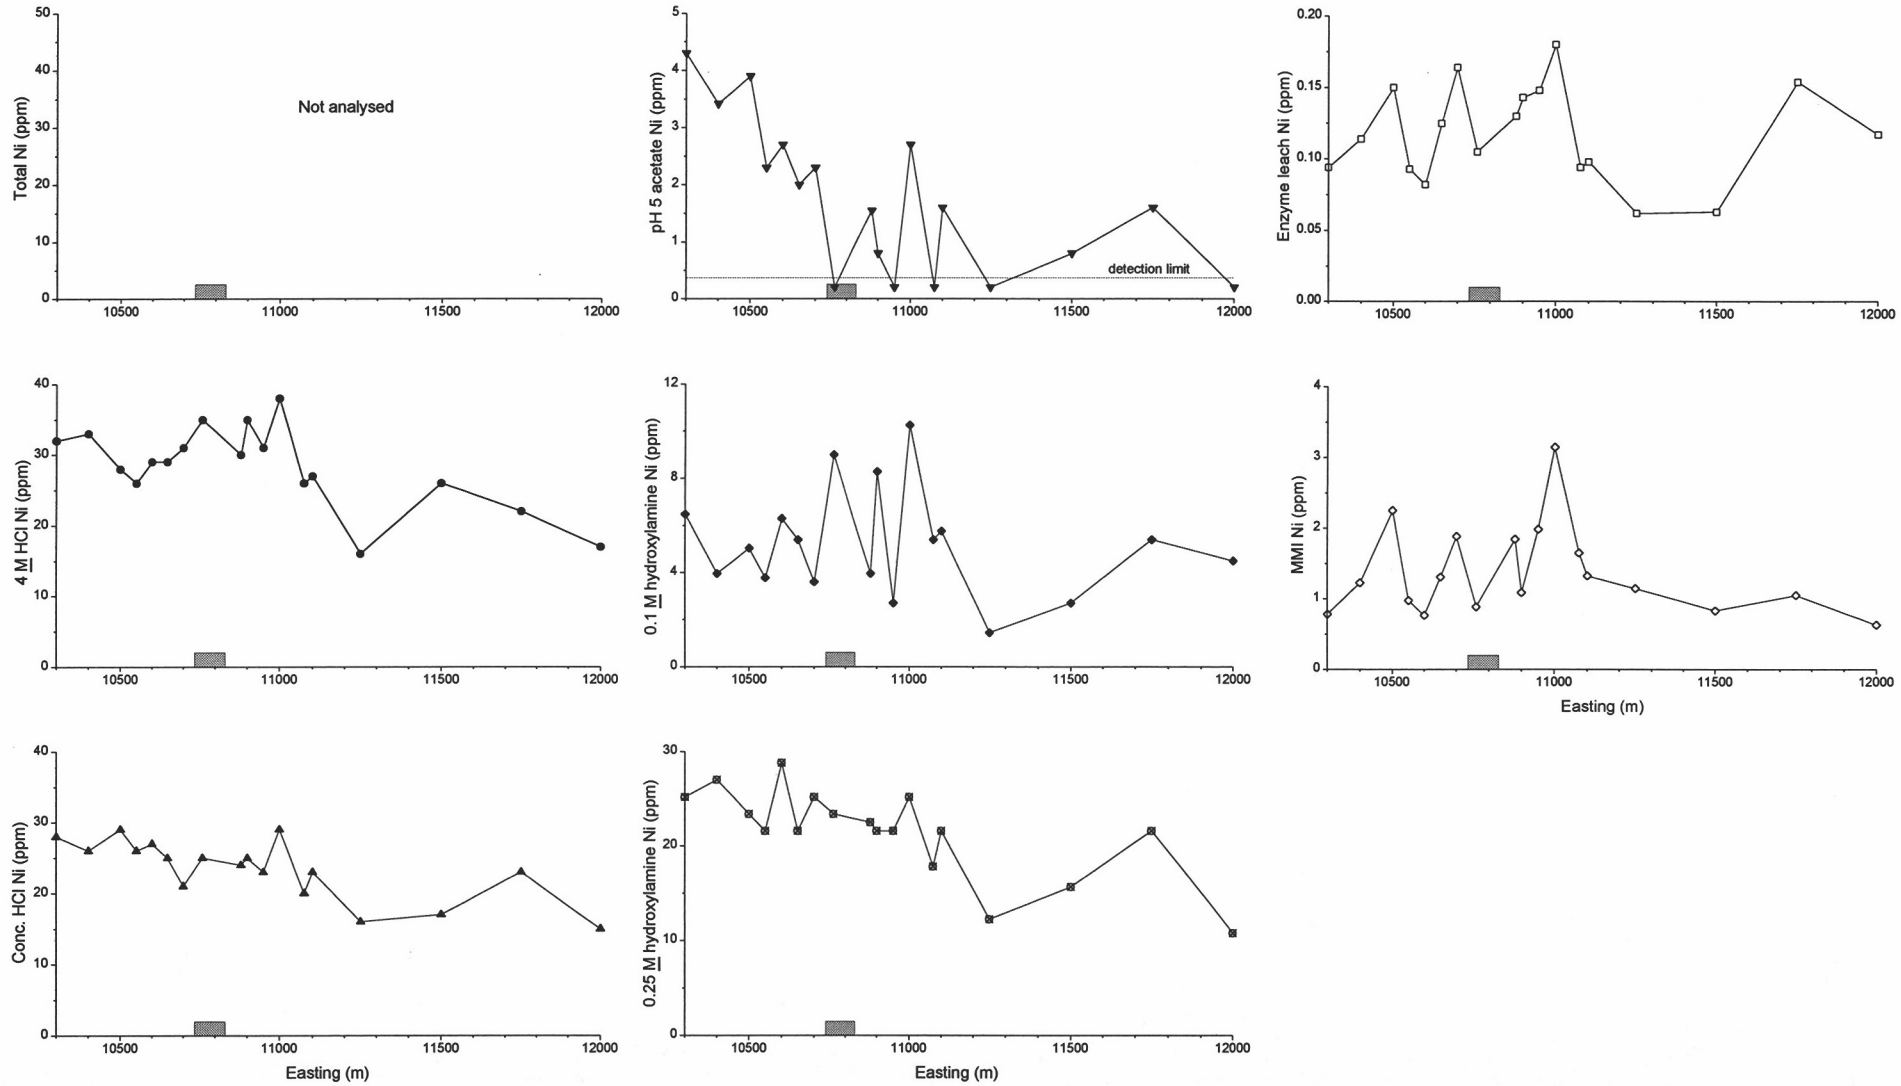

Figure A12.10: Total and extractable Ni from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

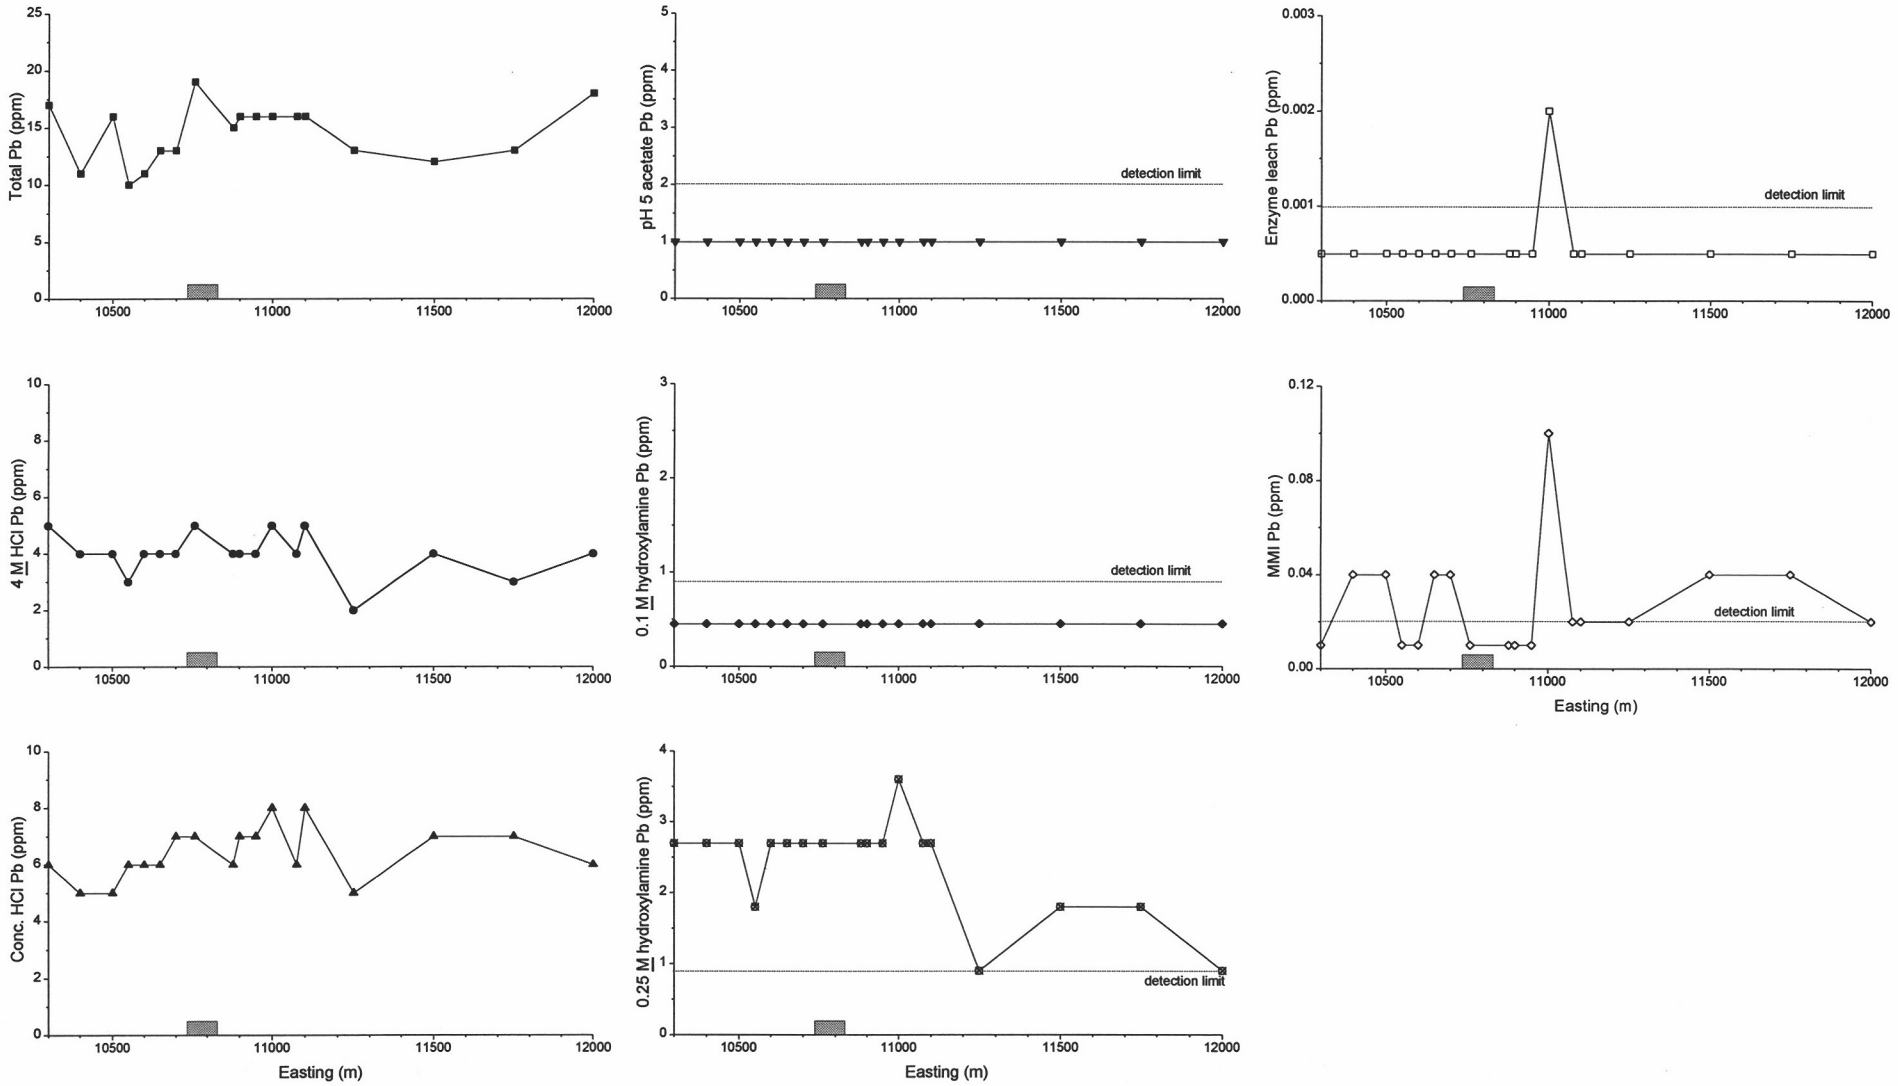

Figure A12.11: Total and extractable Pb from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

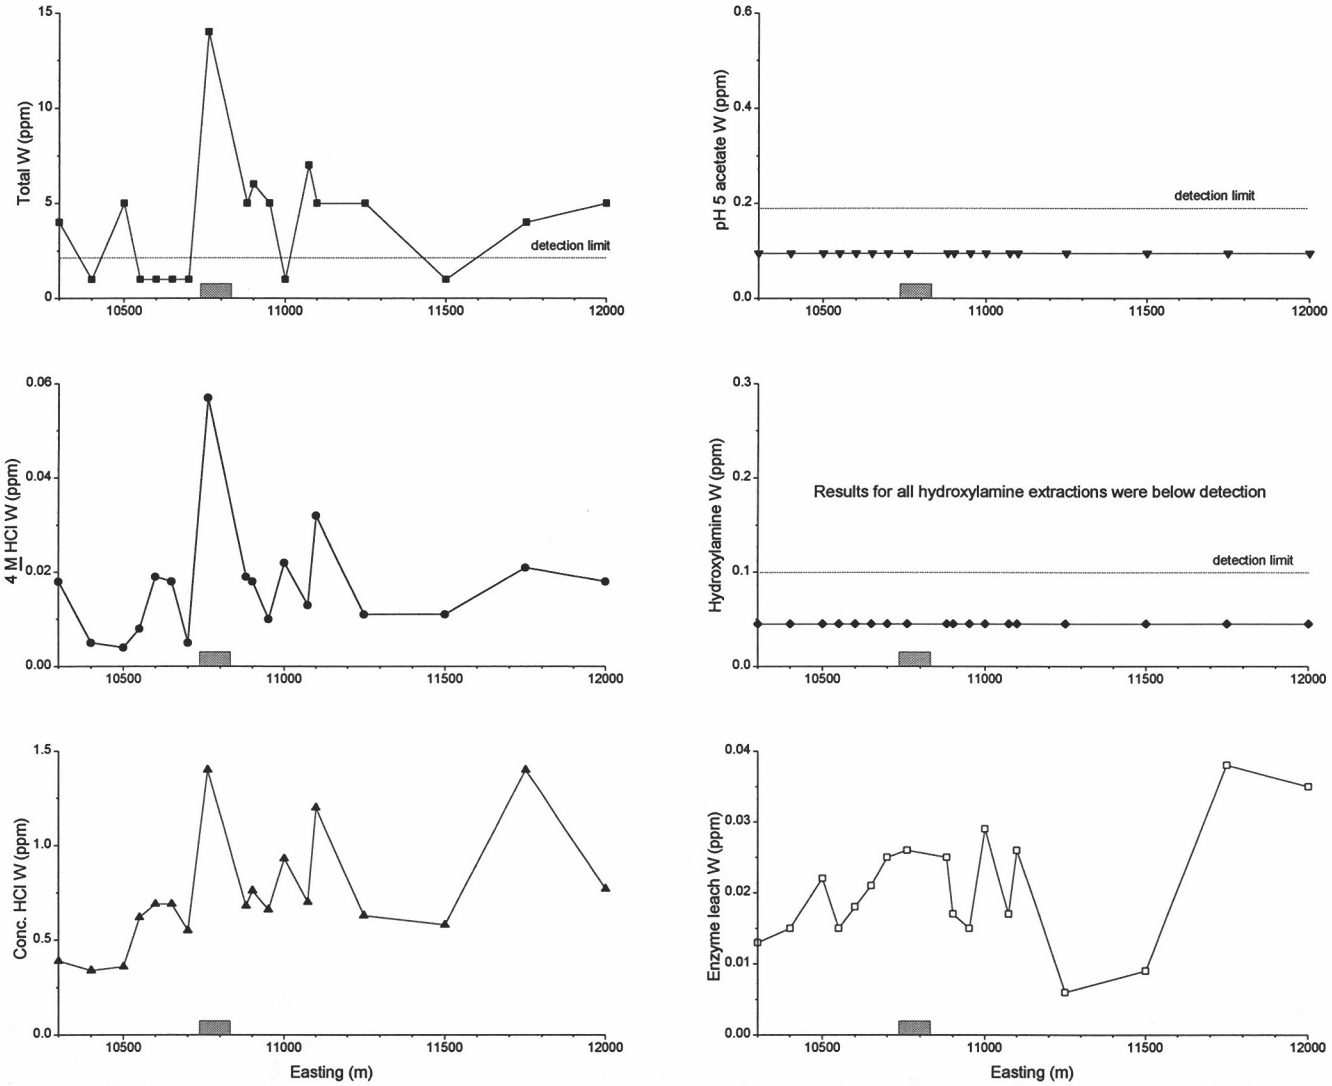

Figure A12.12: Total and extractable W from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

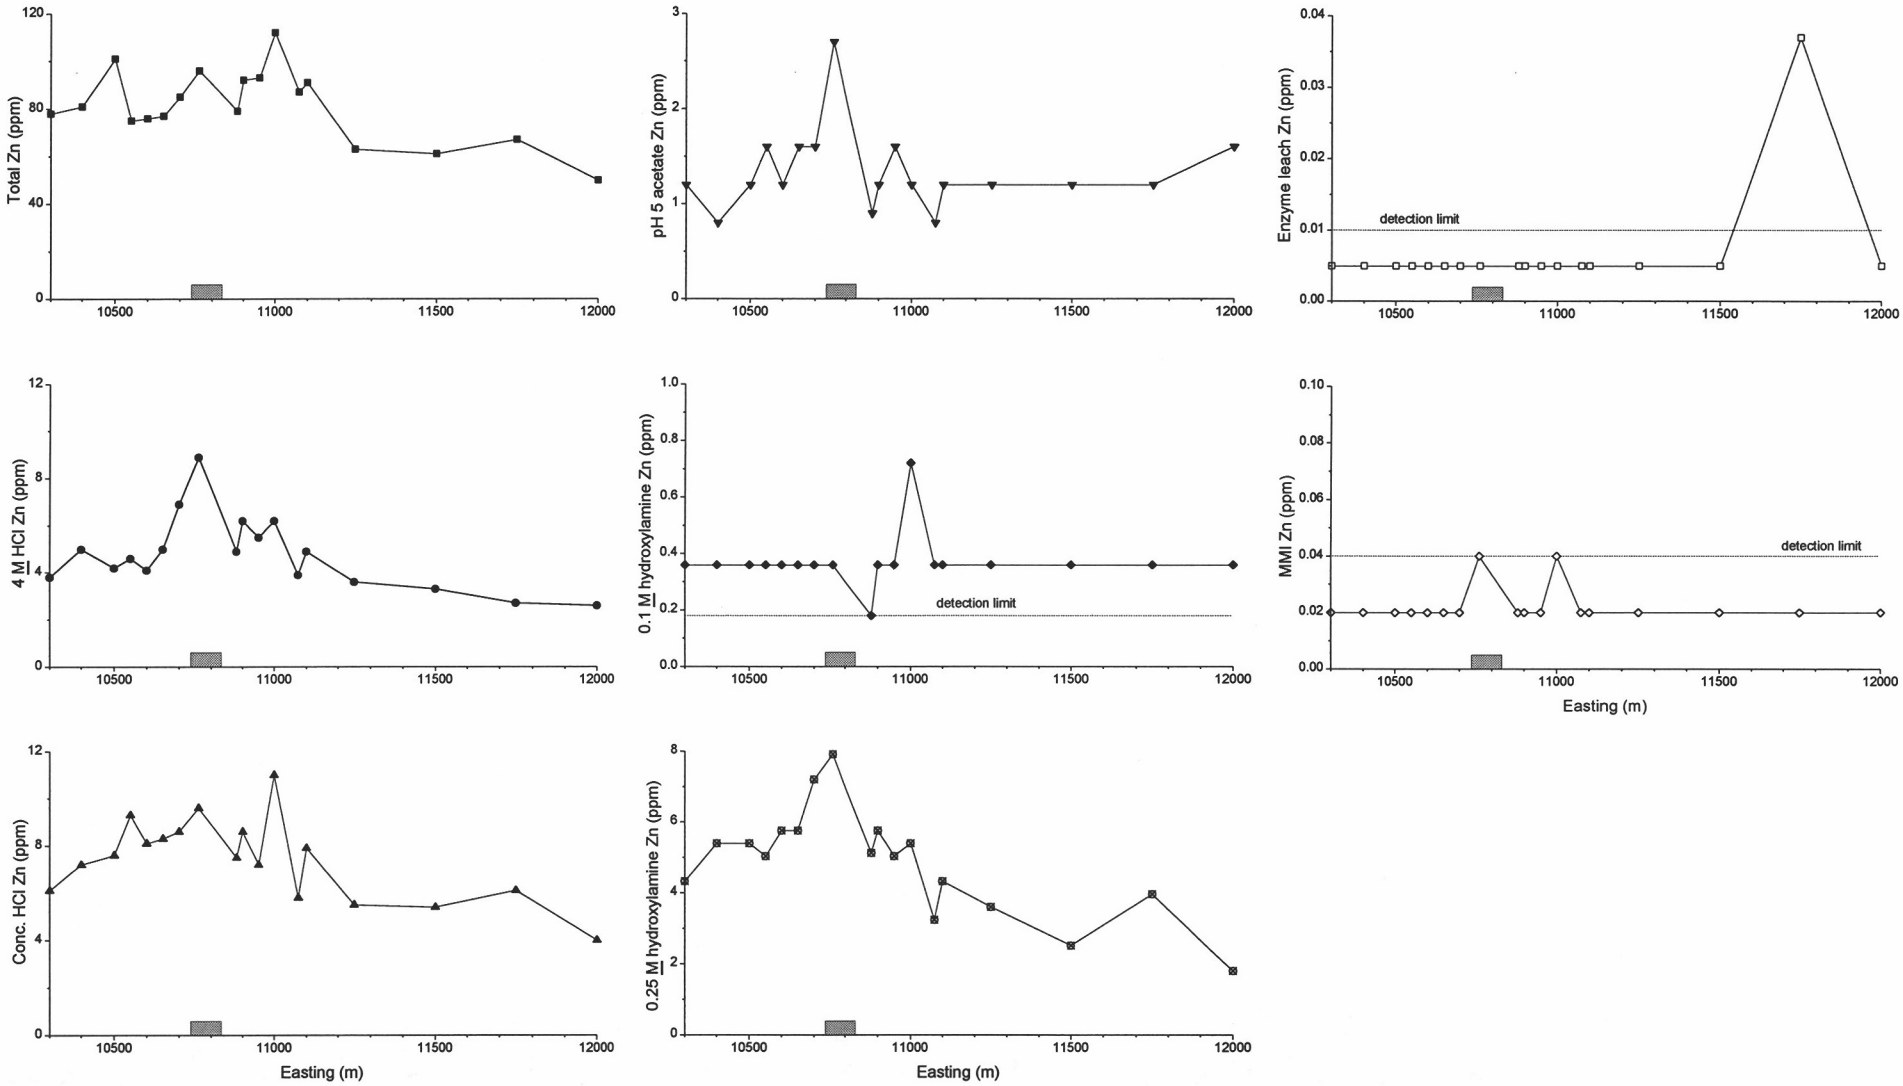

Figure A12.13: Total and extractable Zn from Steinway line 4250N.
(Shaded area represents Au mineralization in Archaean).

Appendix 13: Traverse Data for Apollo

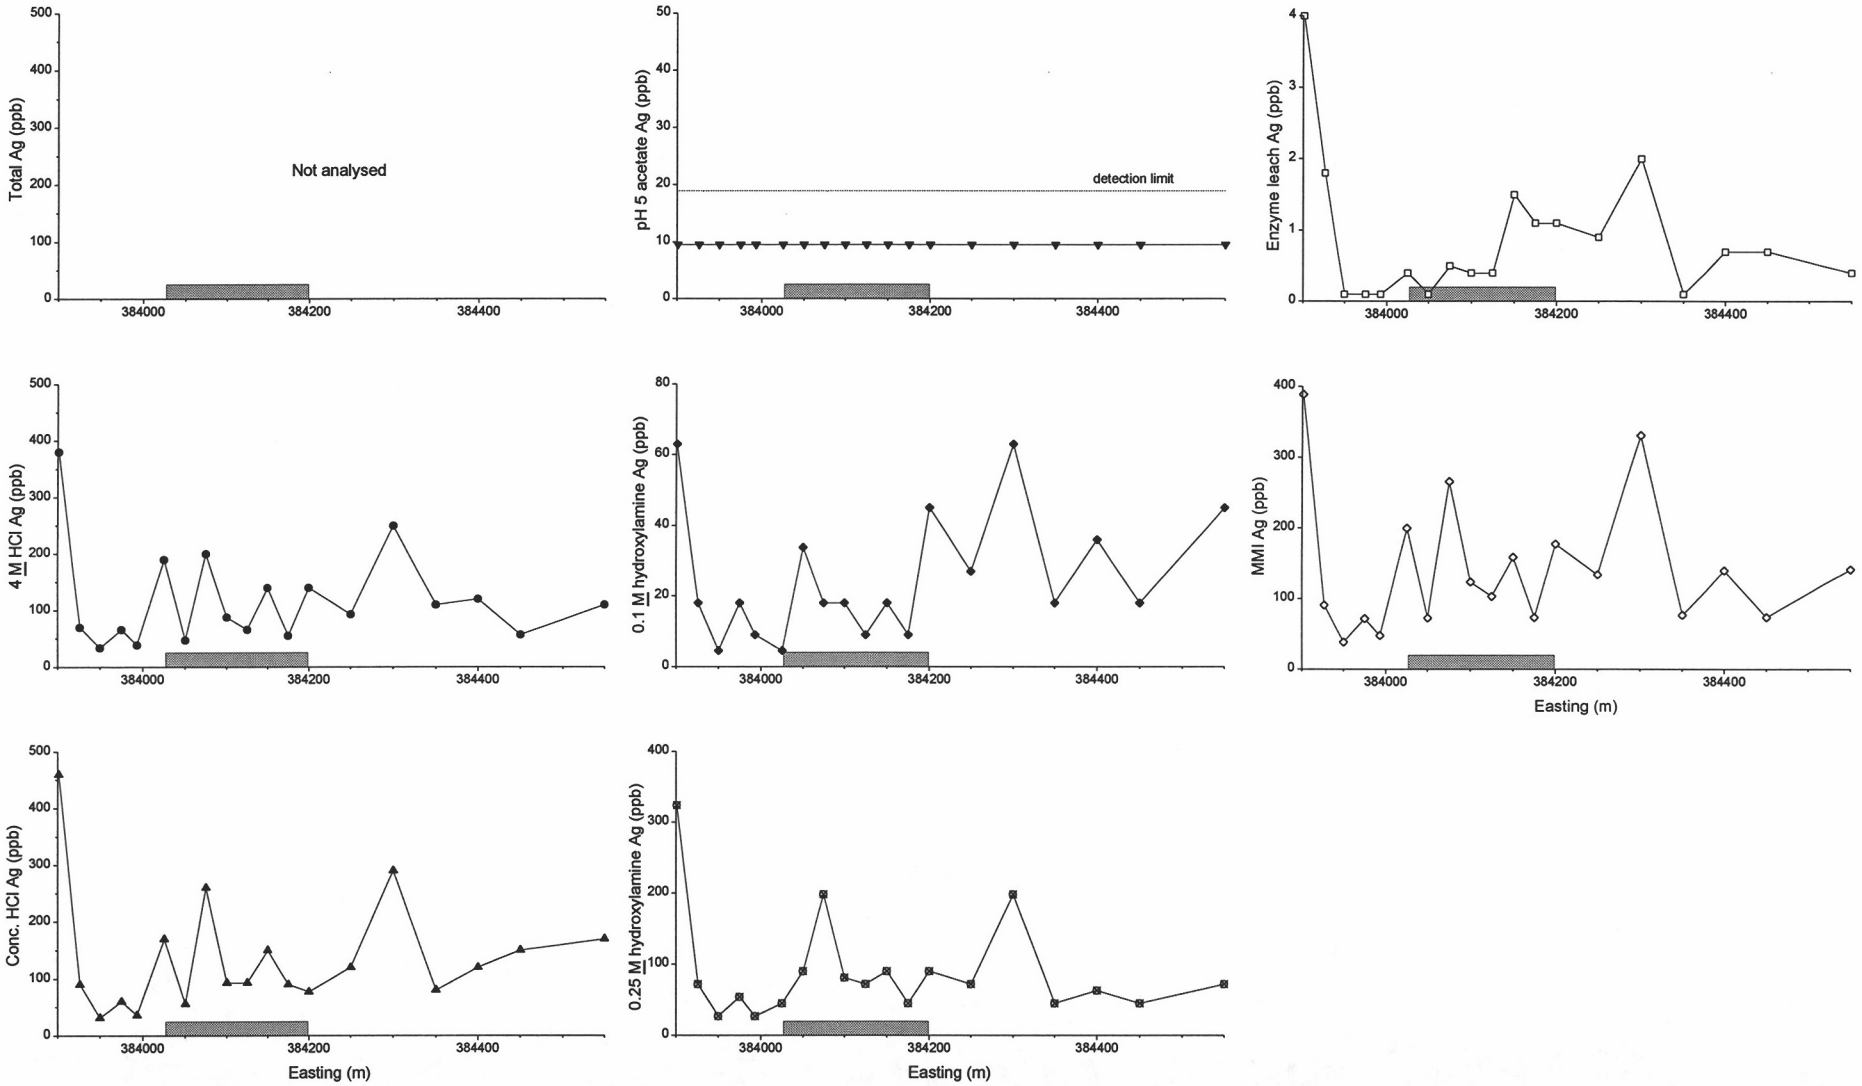

Figure A13.1: Total and extractable Ag from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).

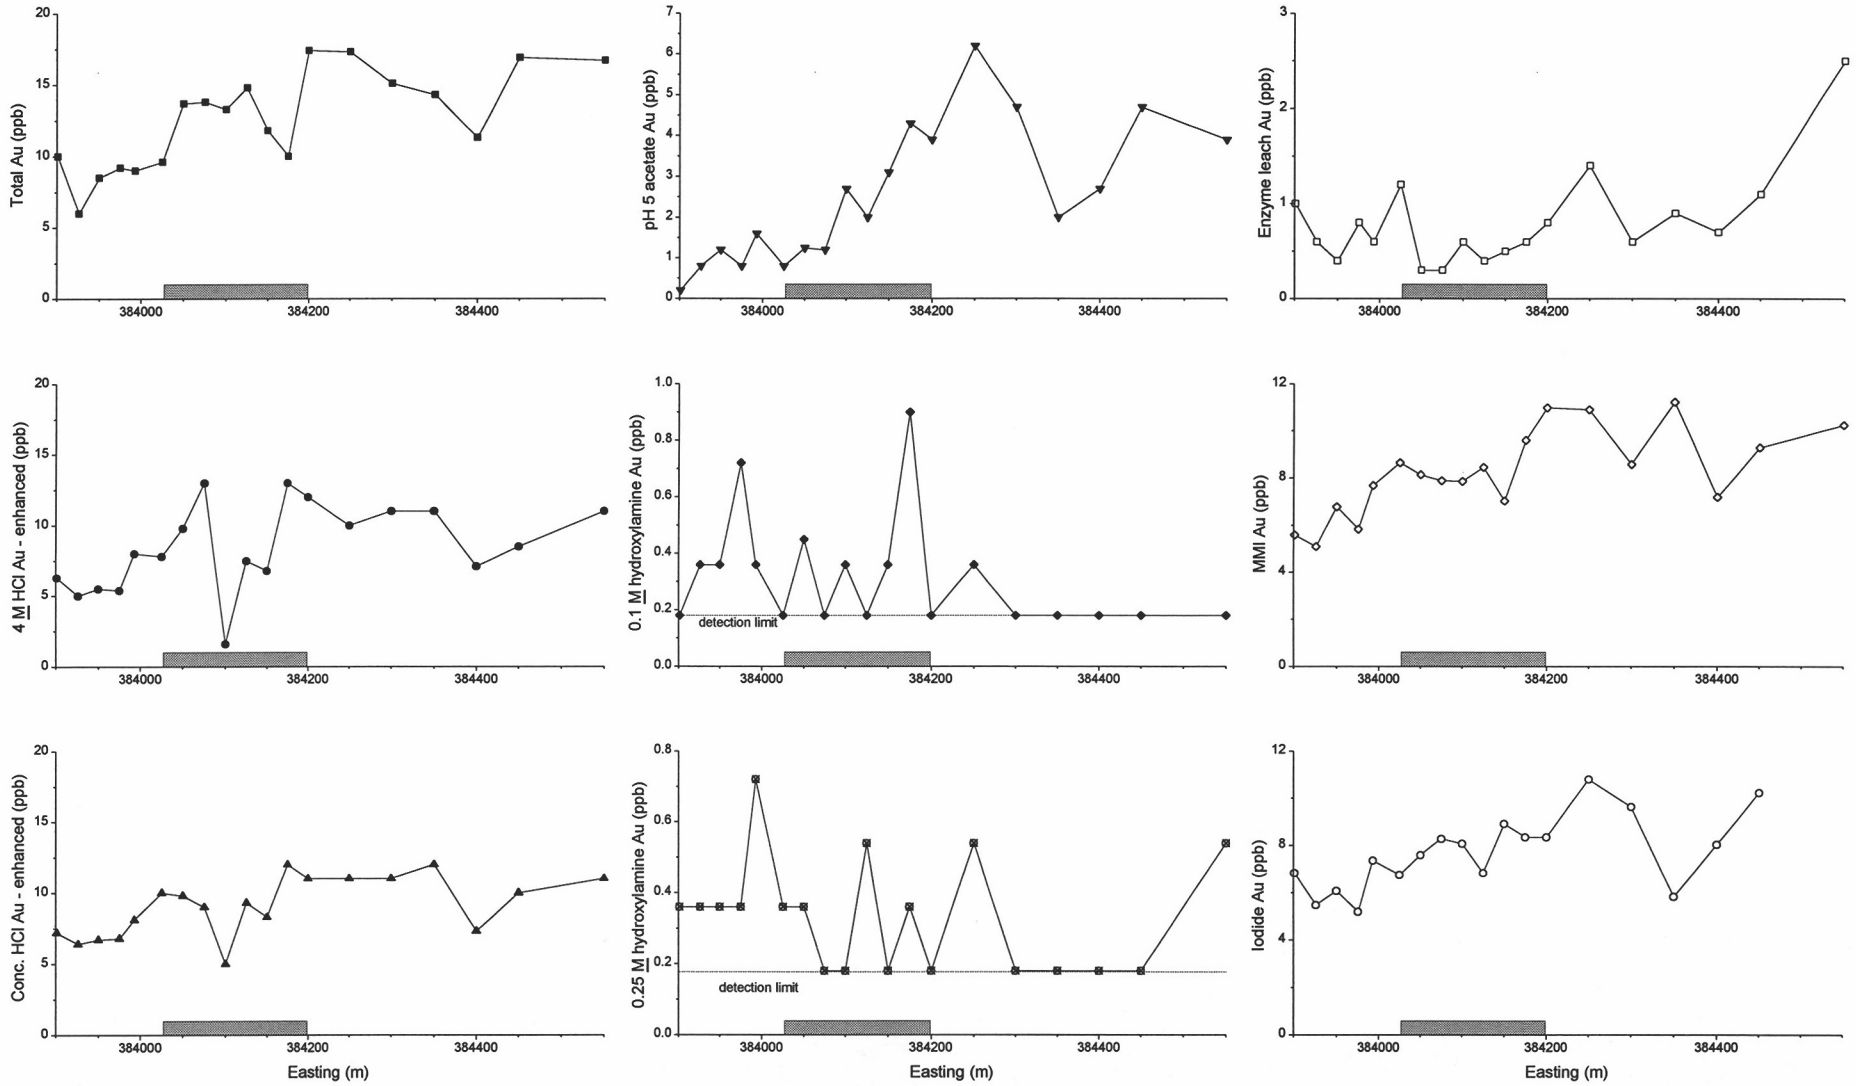

Figure A13.2: Total and extractable Au from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).

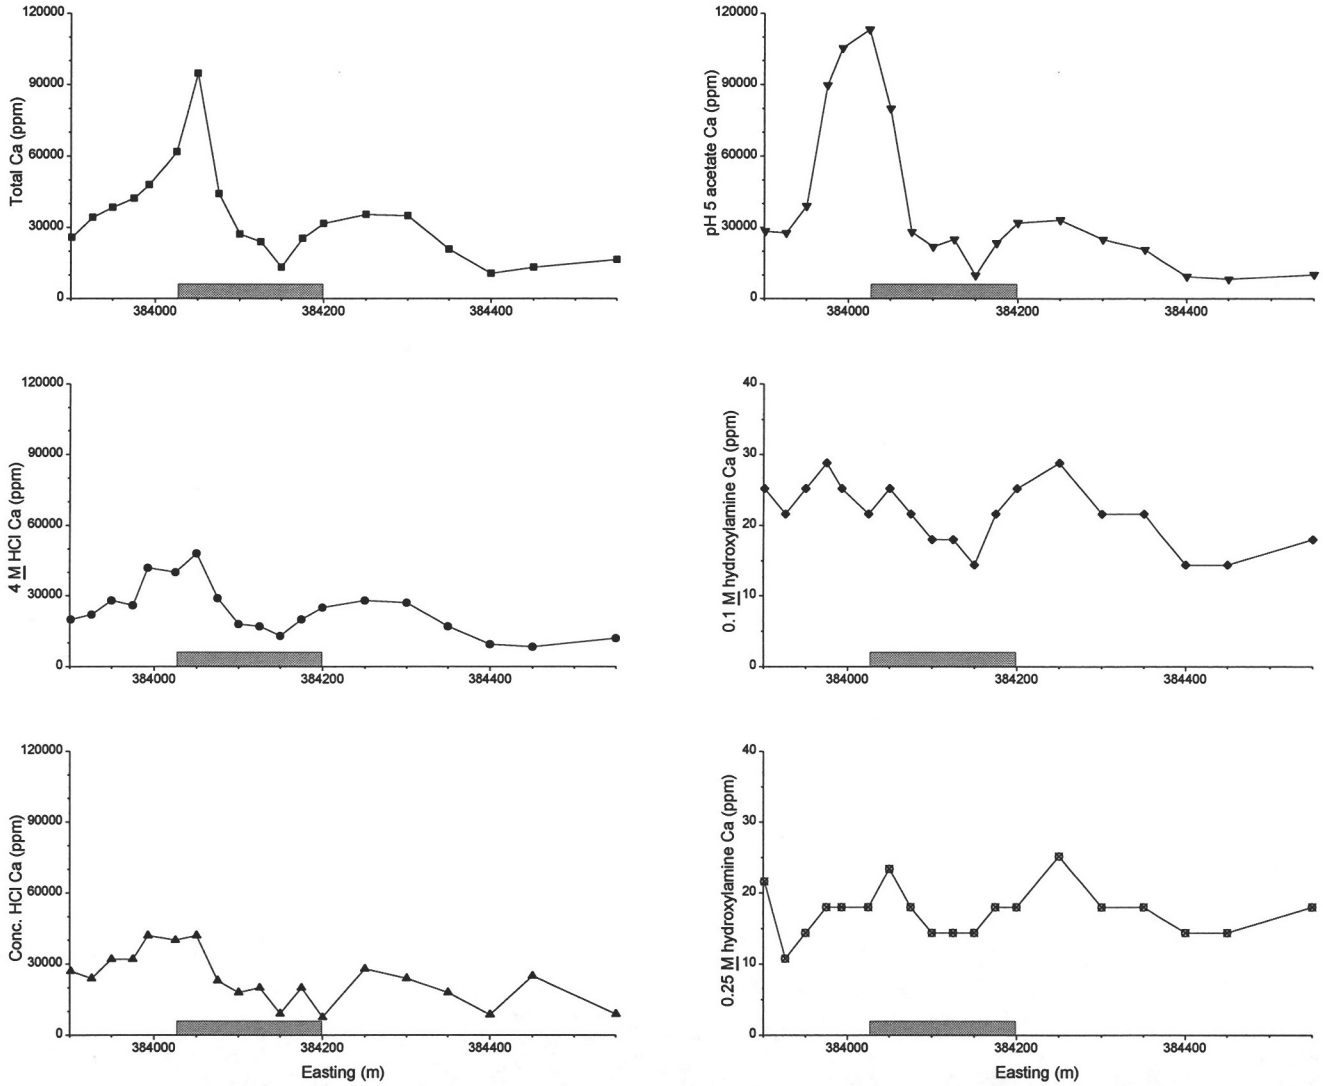

Figure A13.3: Total and extractable Ca from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).

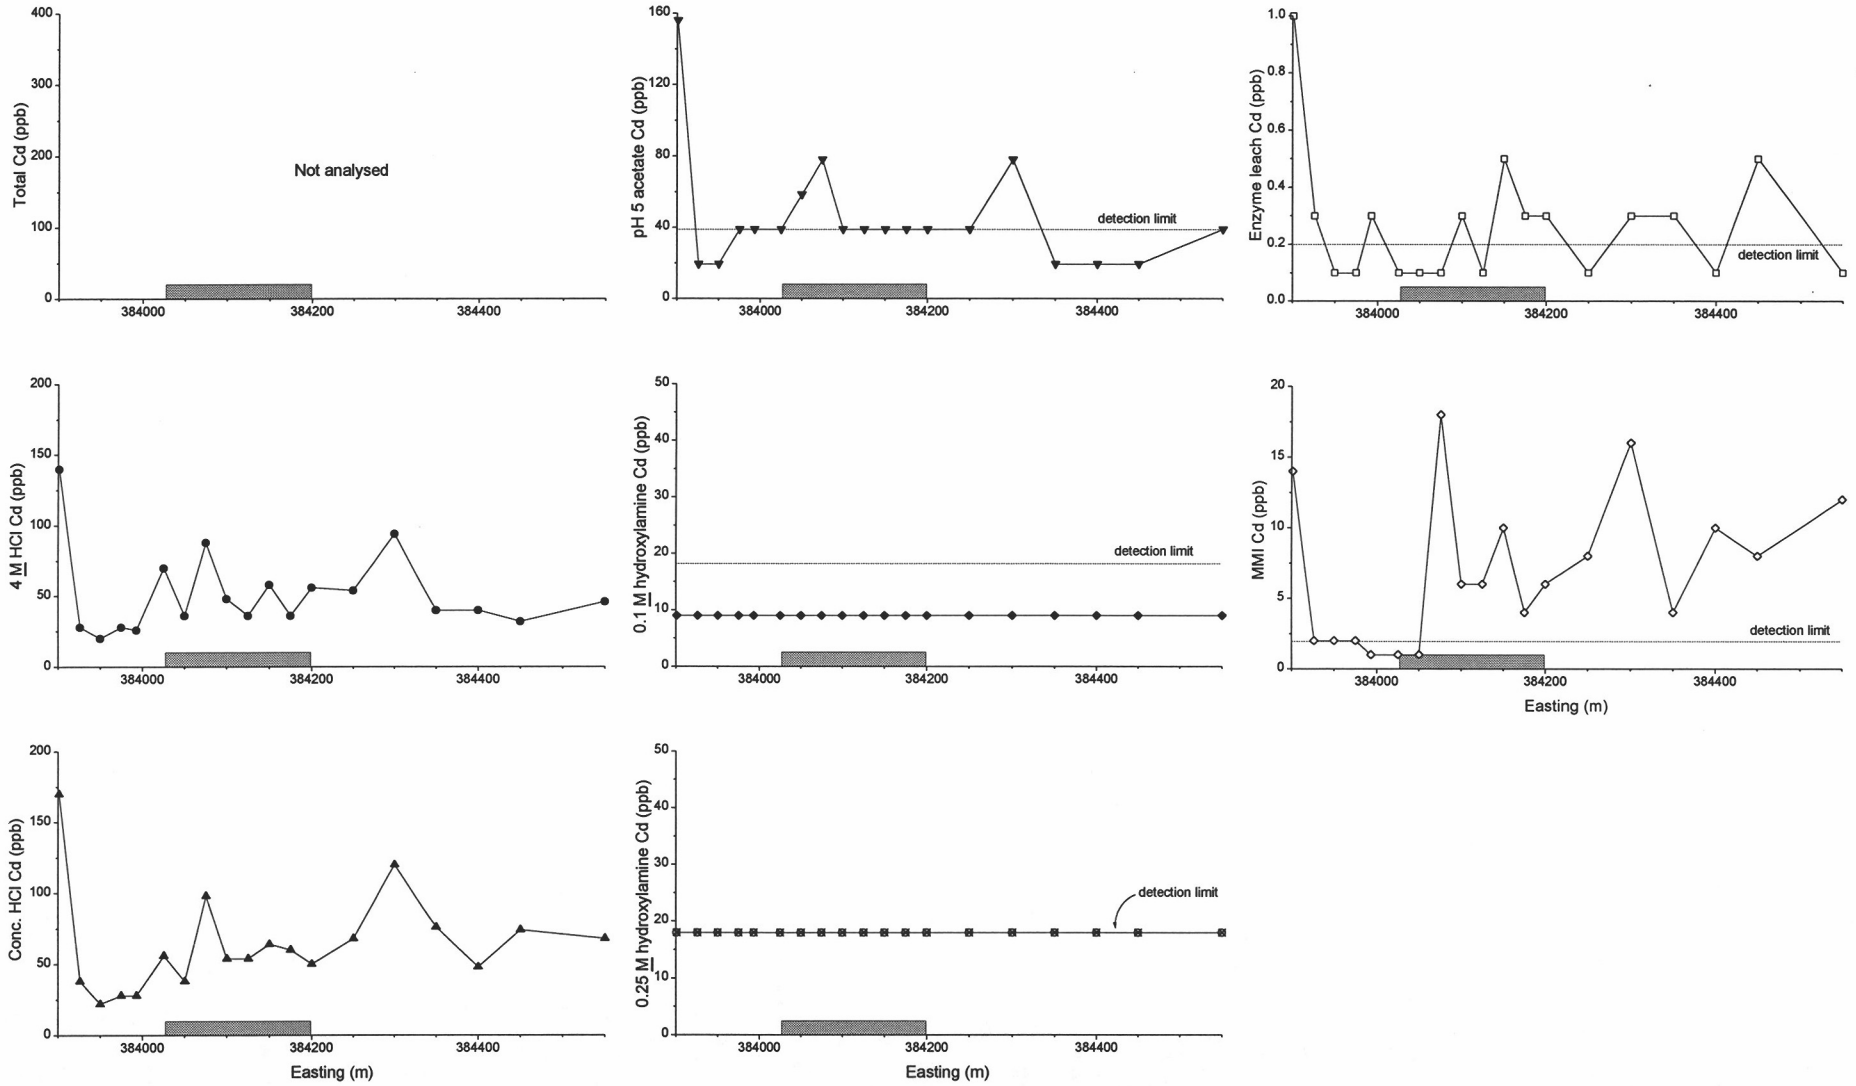

Figure A13.4: Total and extractable Cd from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).

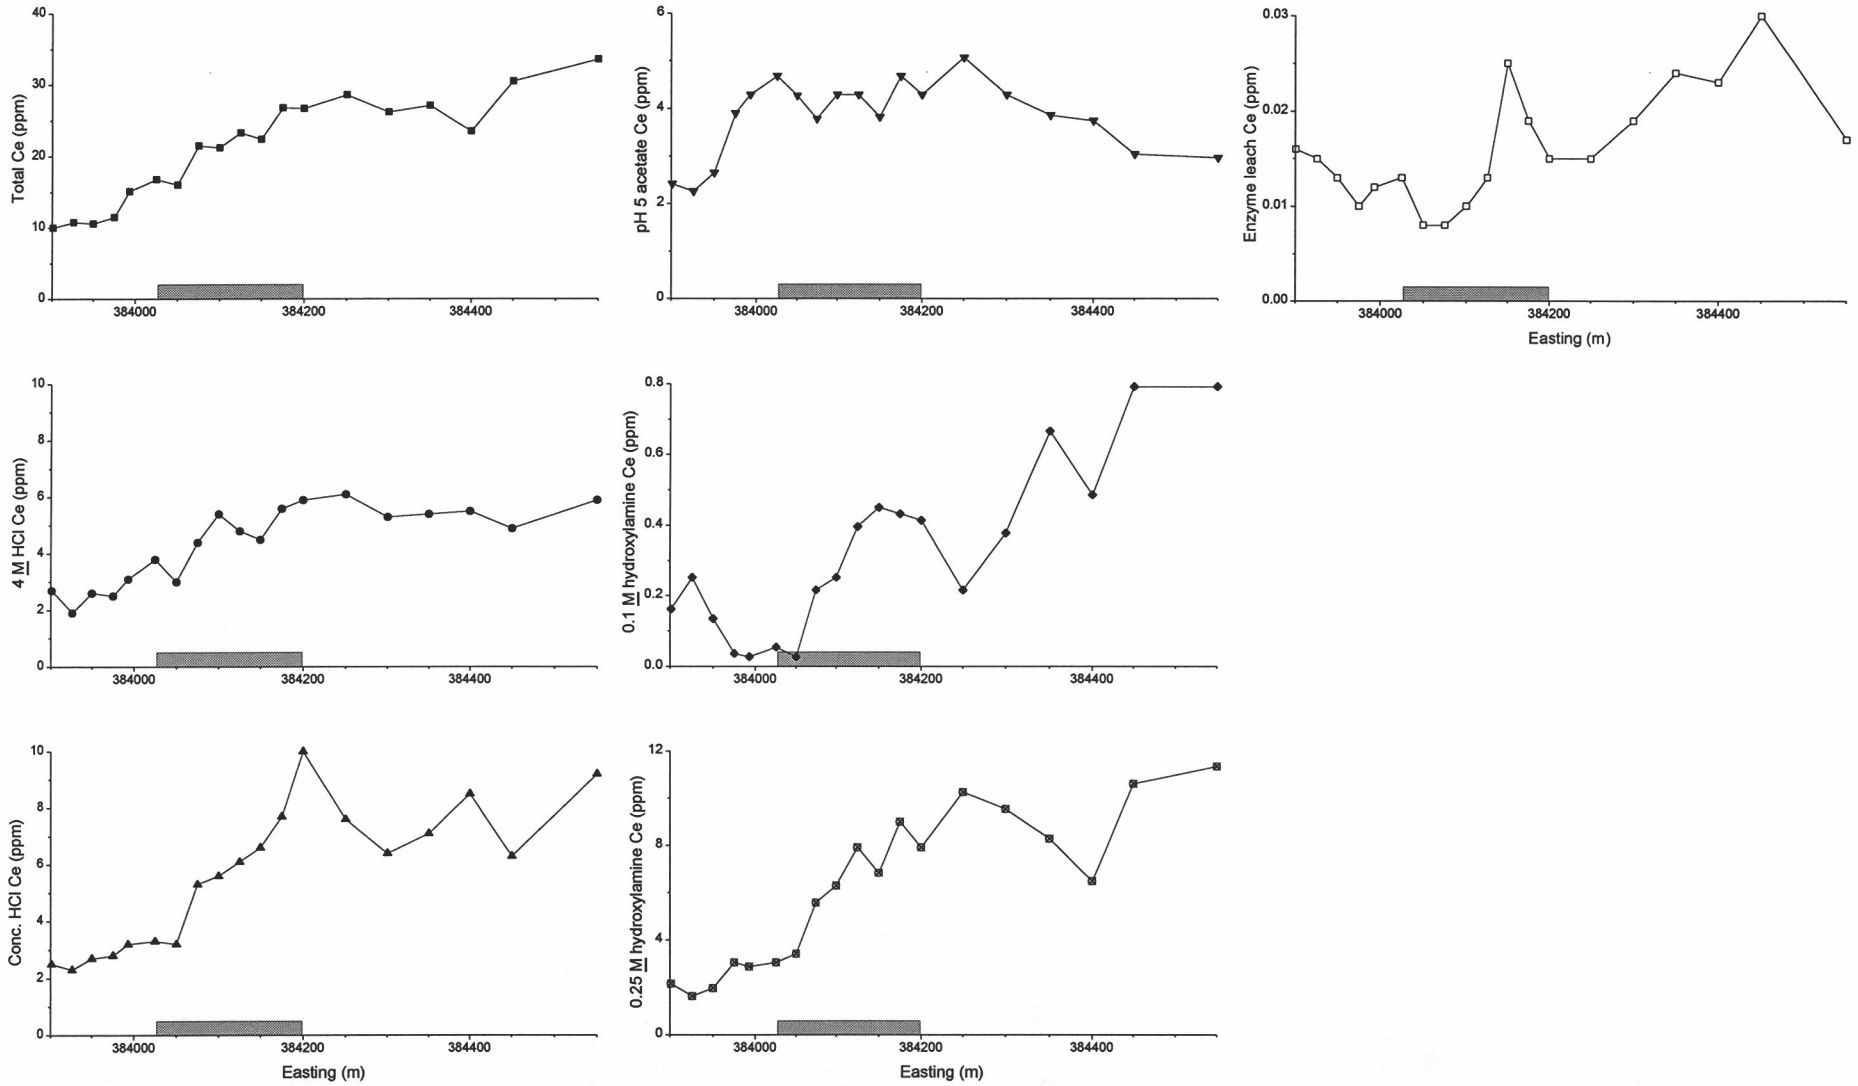

Figure A13.5: Total and extractable Ce from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).

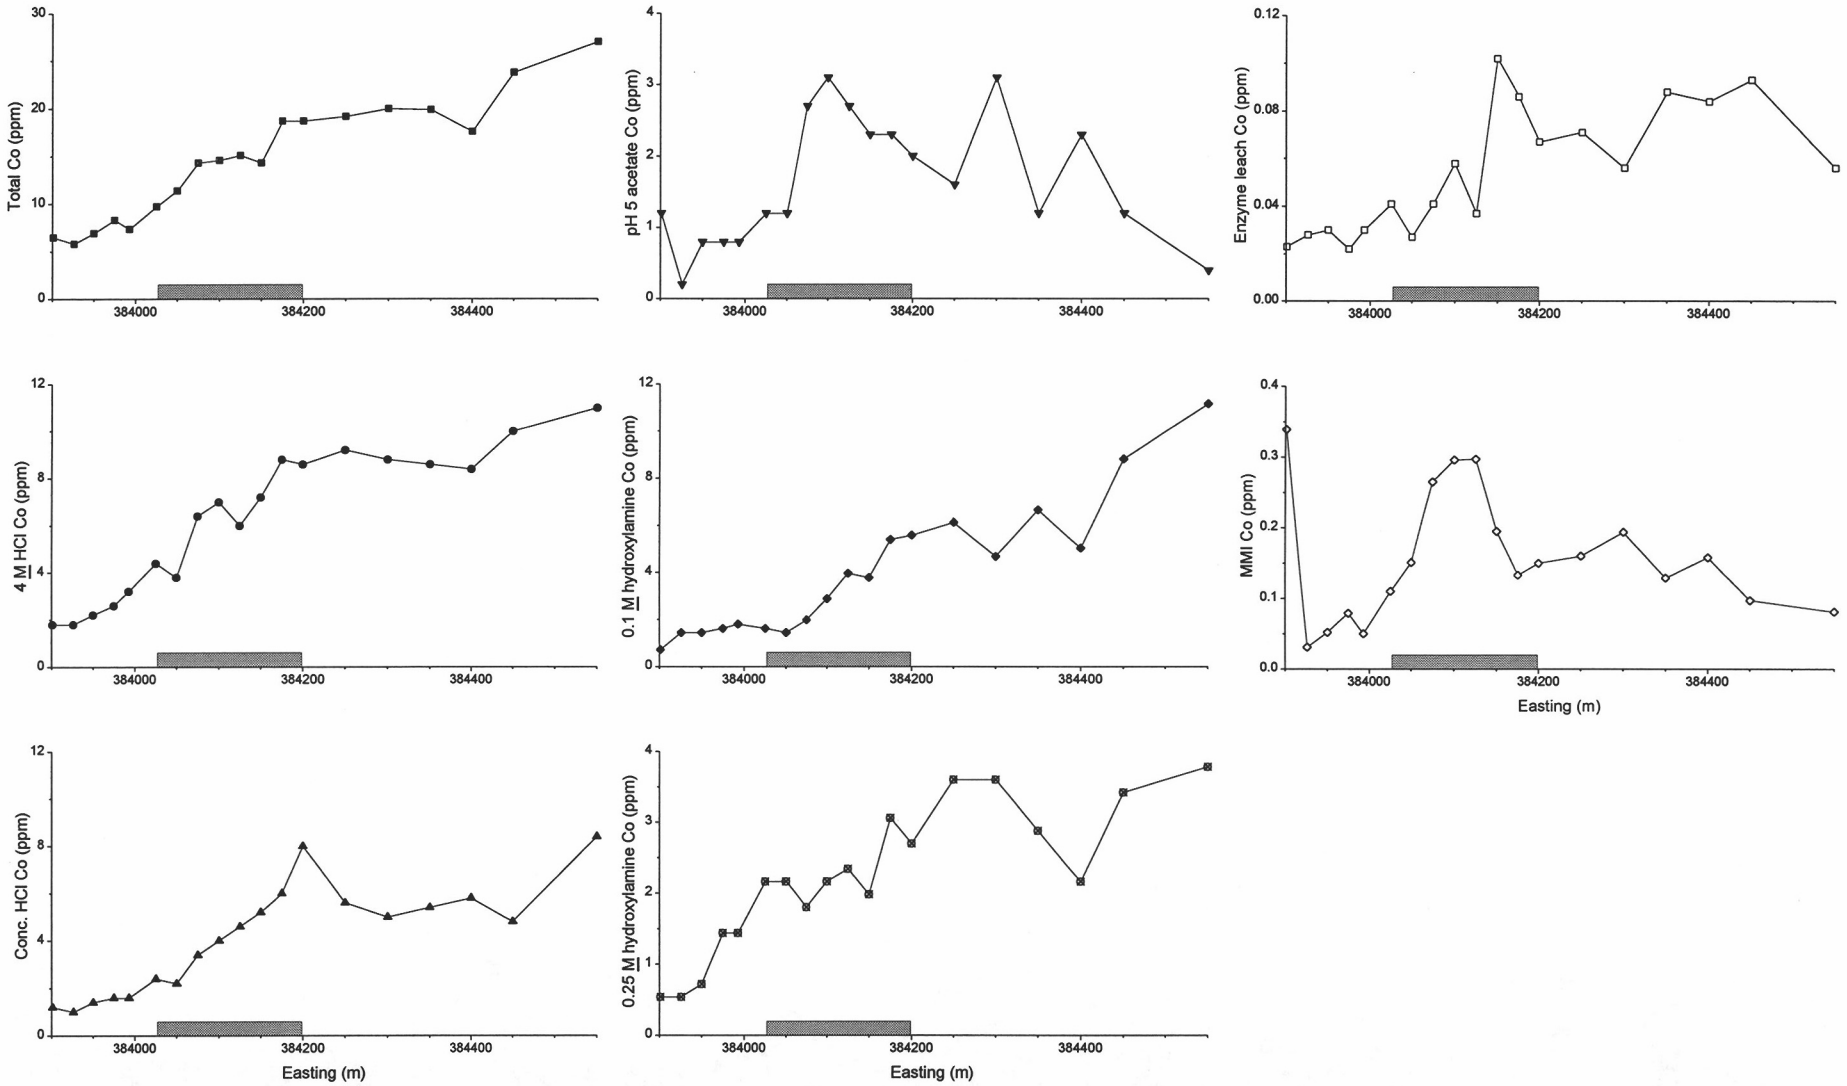

Figure A13.6: Total and extractable Co from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).

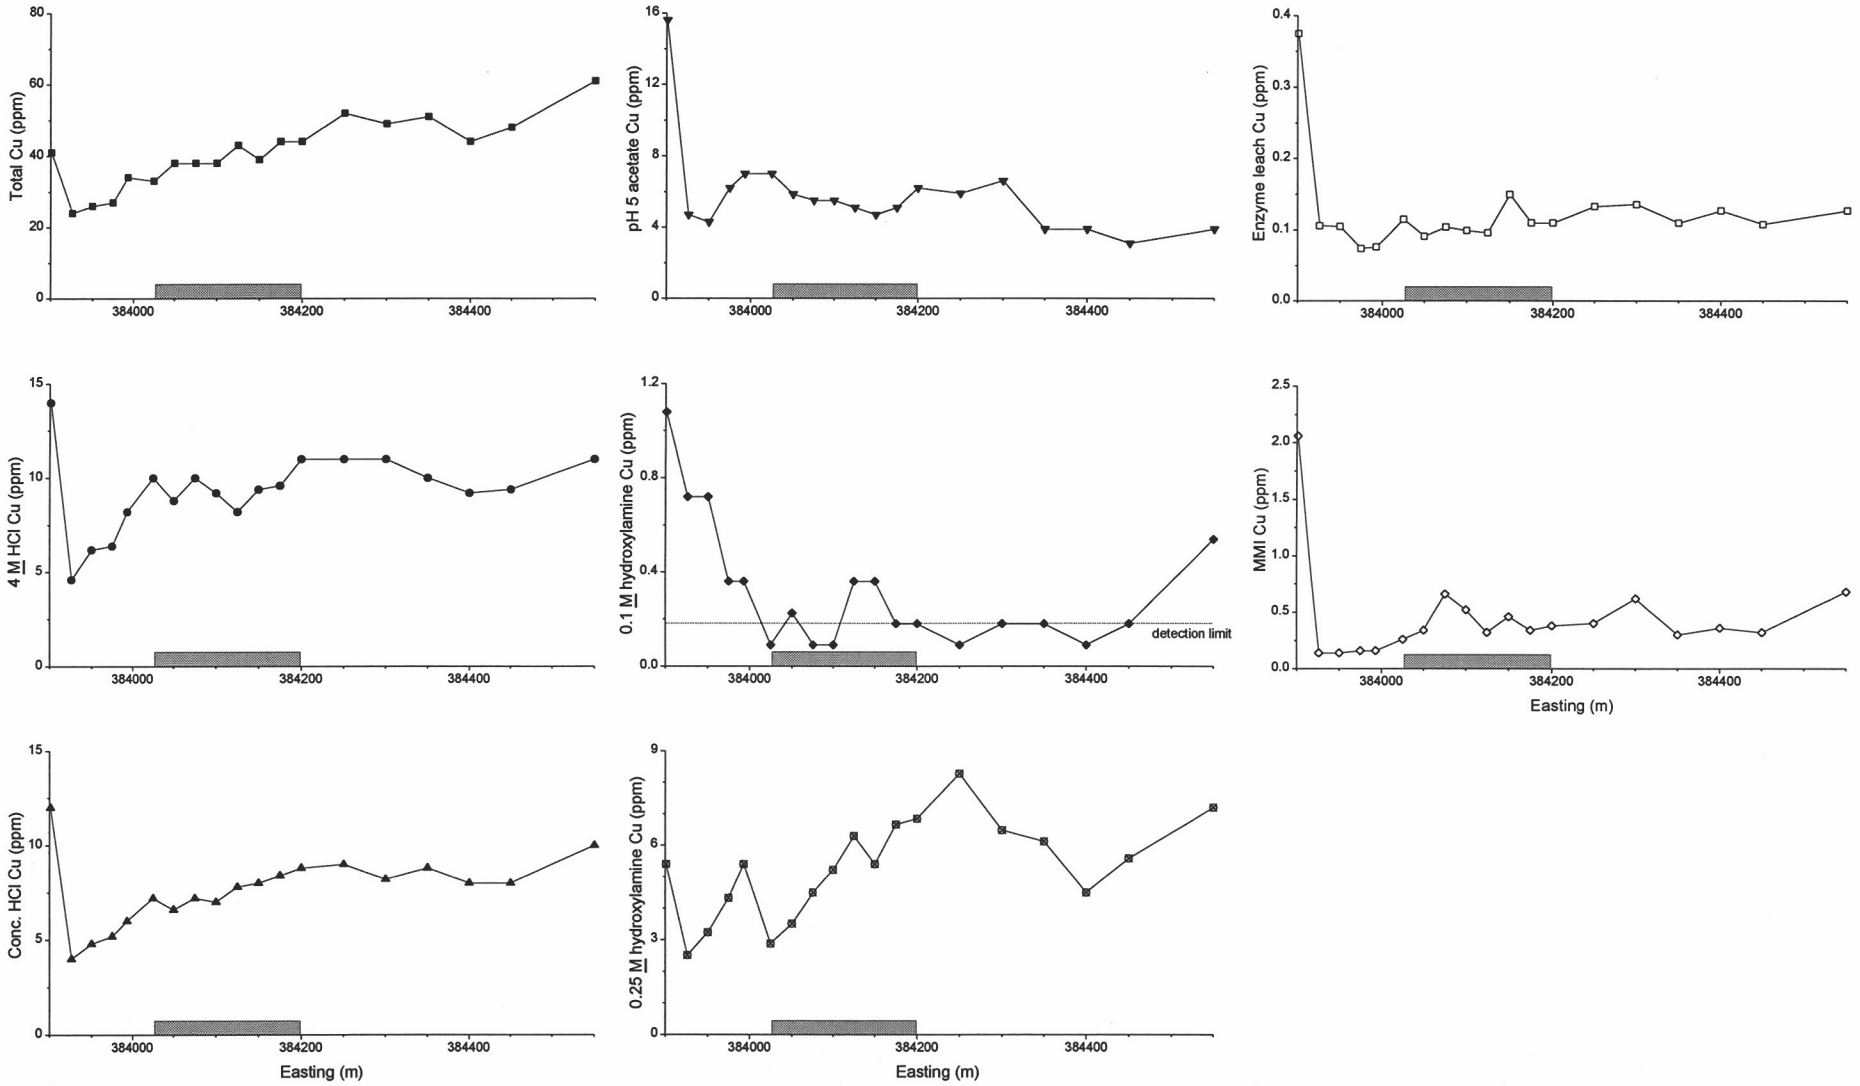

Figure A13.7: Total and extractable Cu from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).

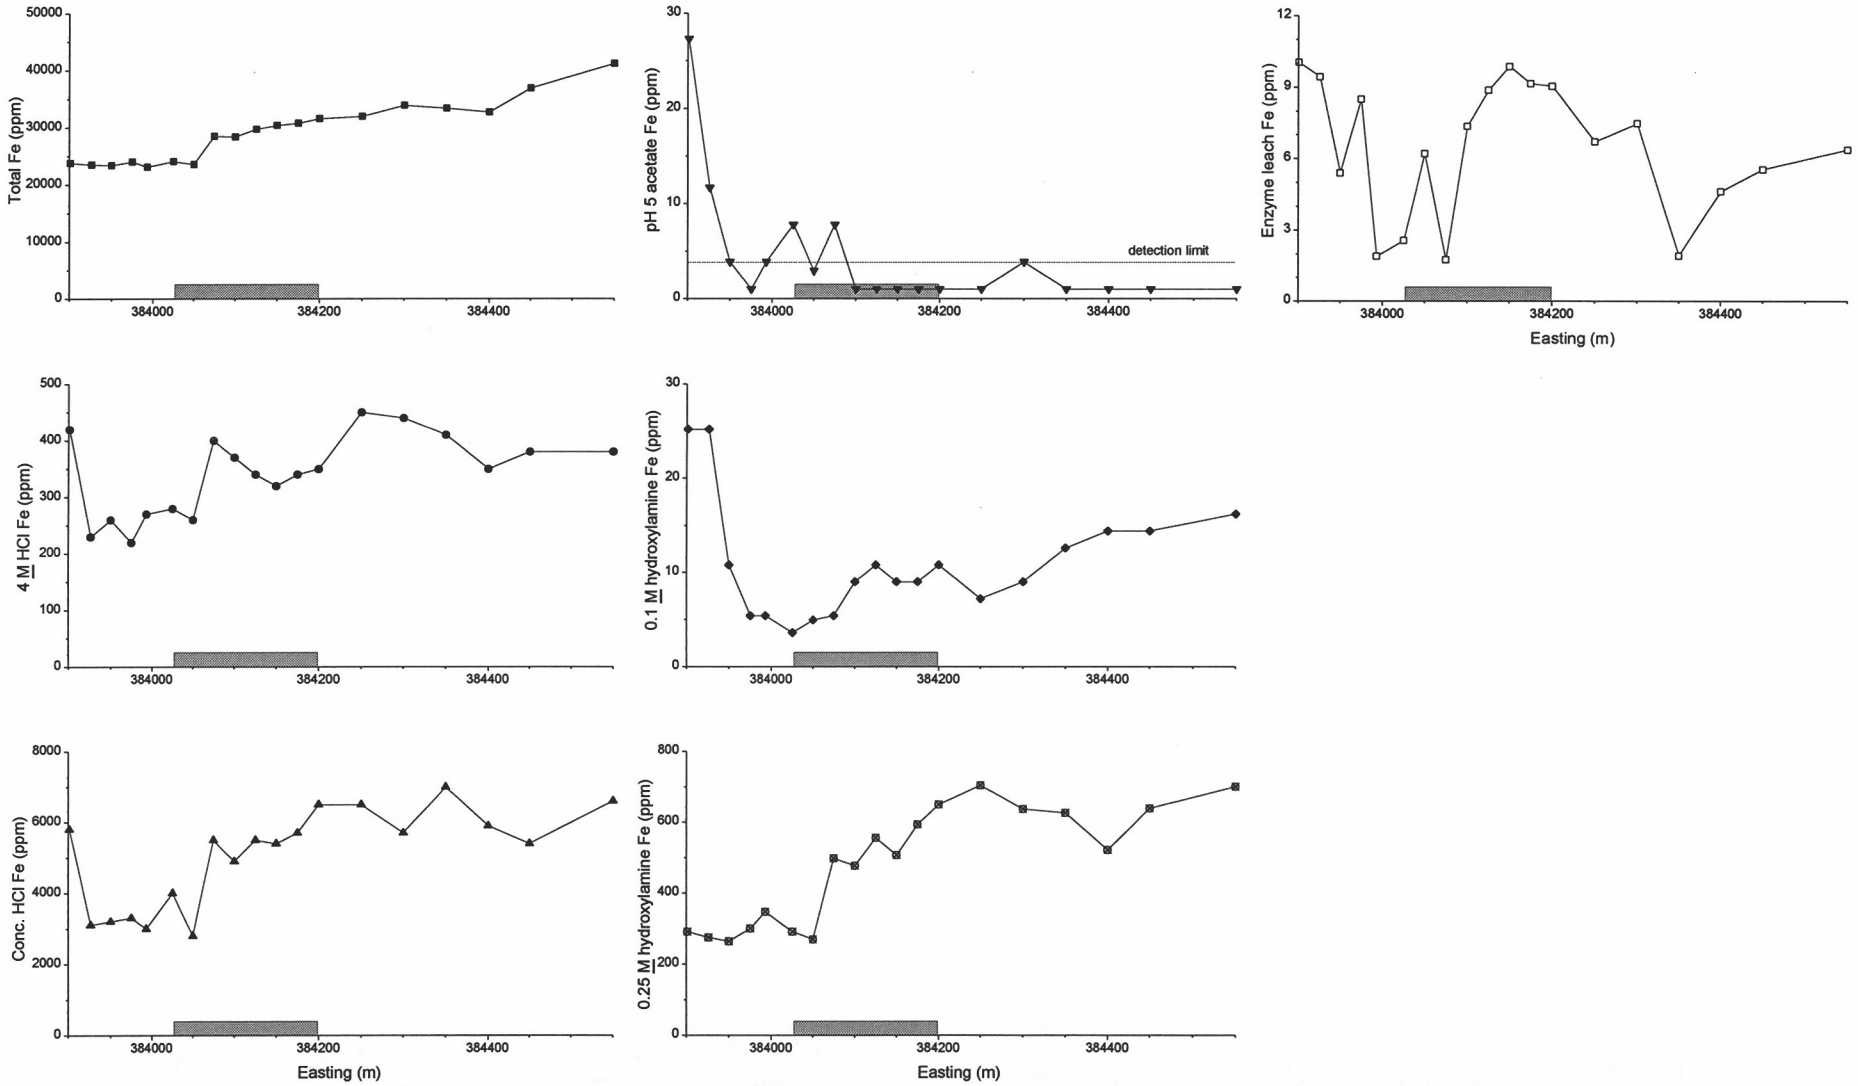

Figure A13.8: Total and extractable Fe from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).

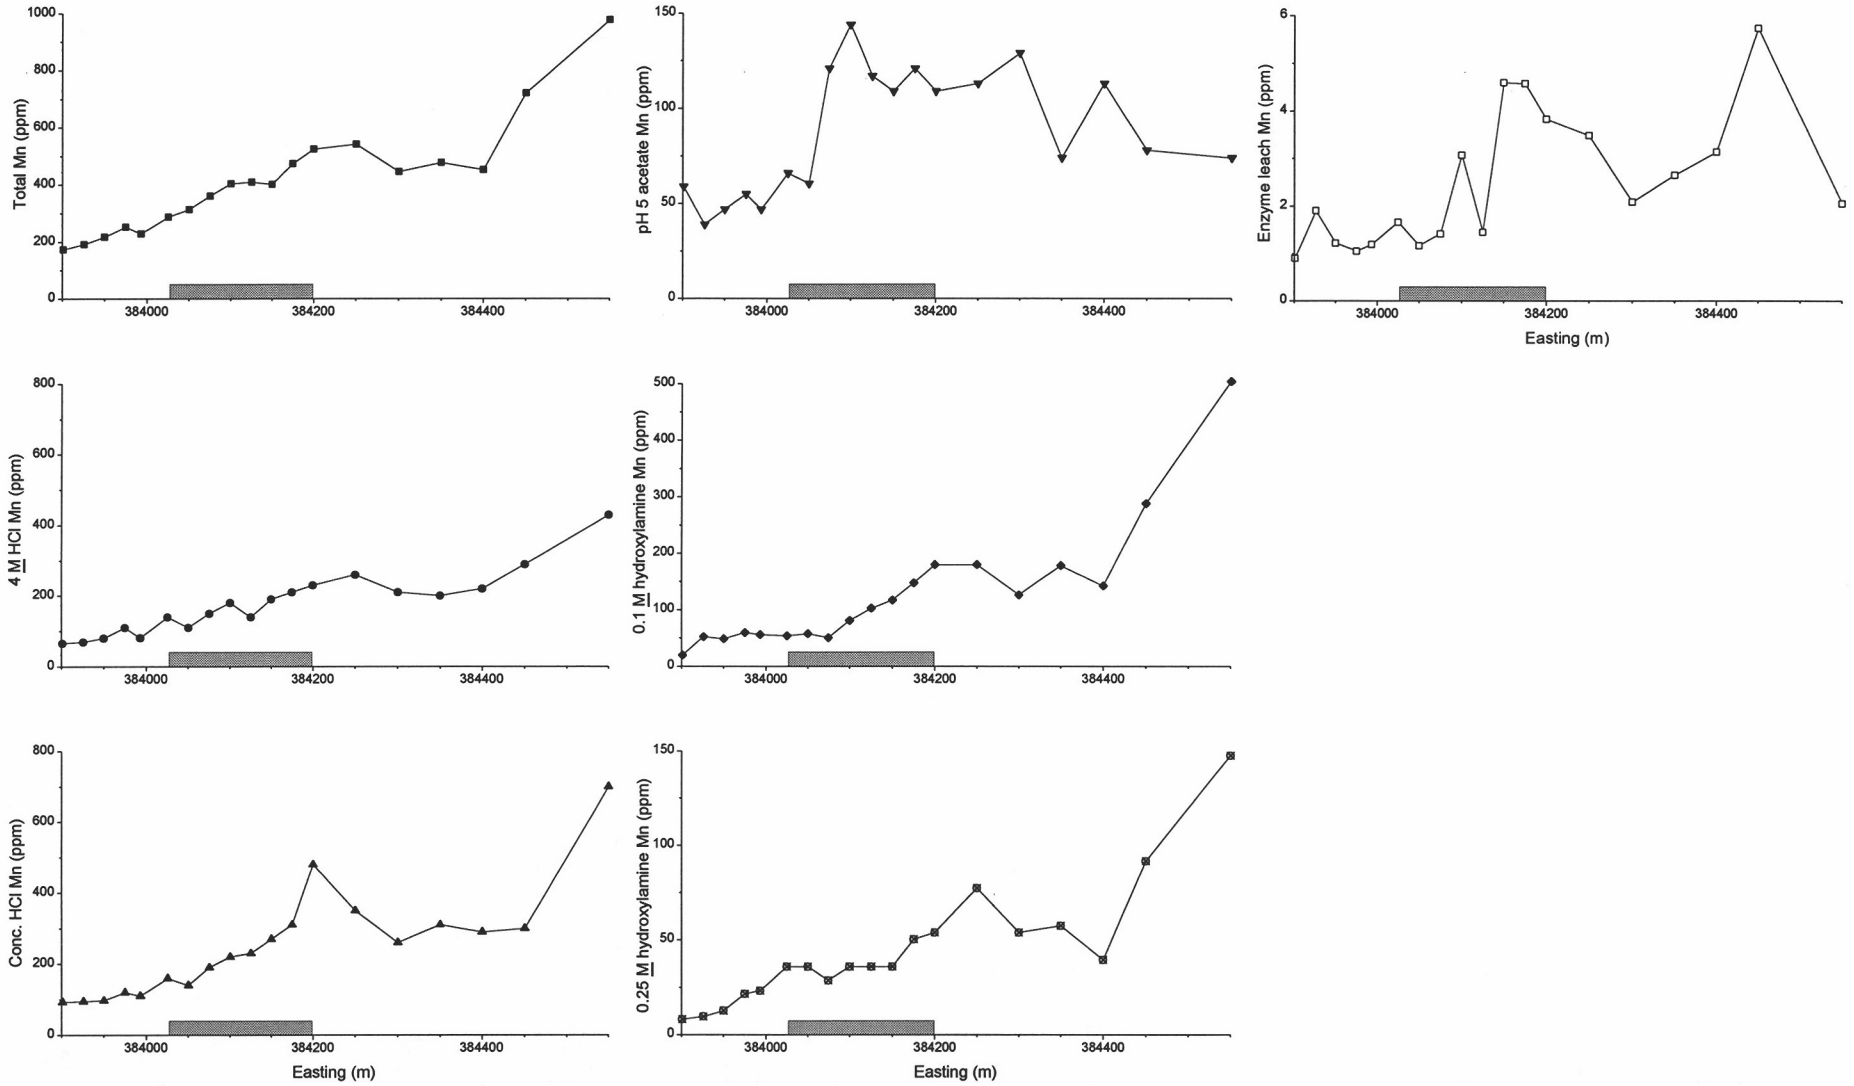

Figure A13.9: Total and extractable Mn from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).

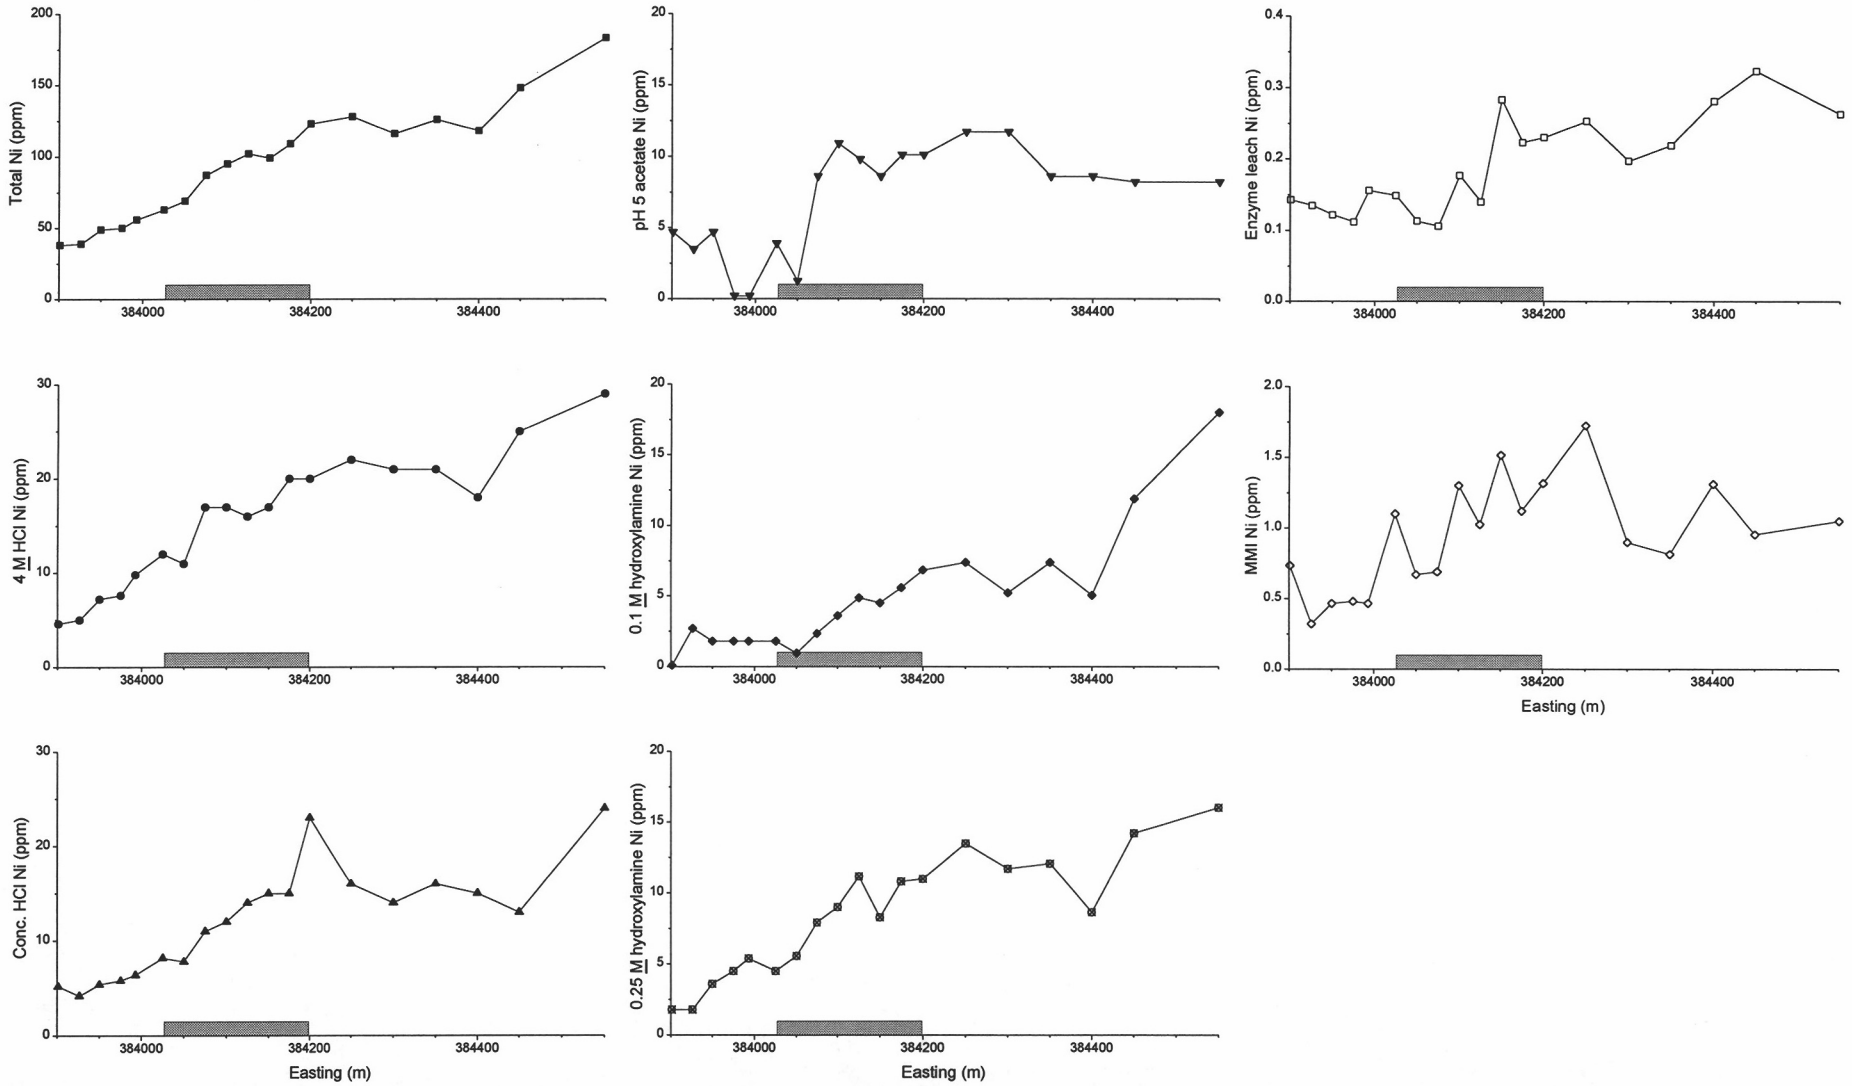

Figure A13.10: Total and extractable Ni from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).

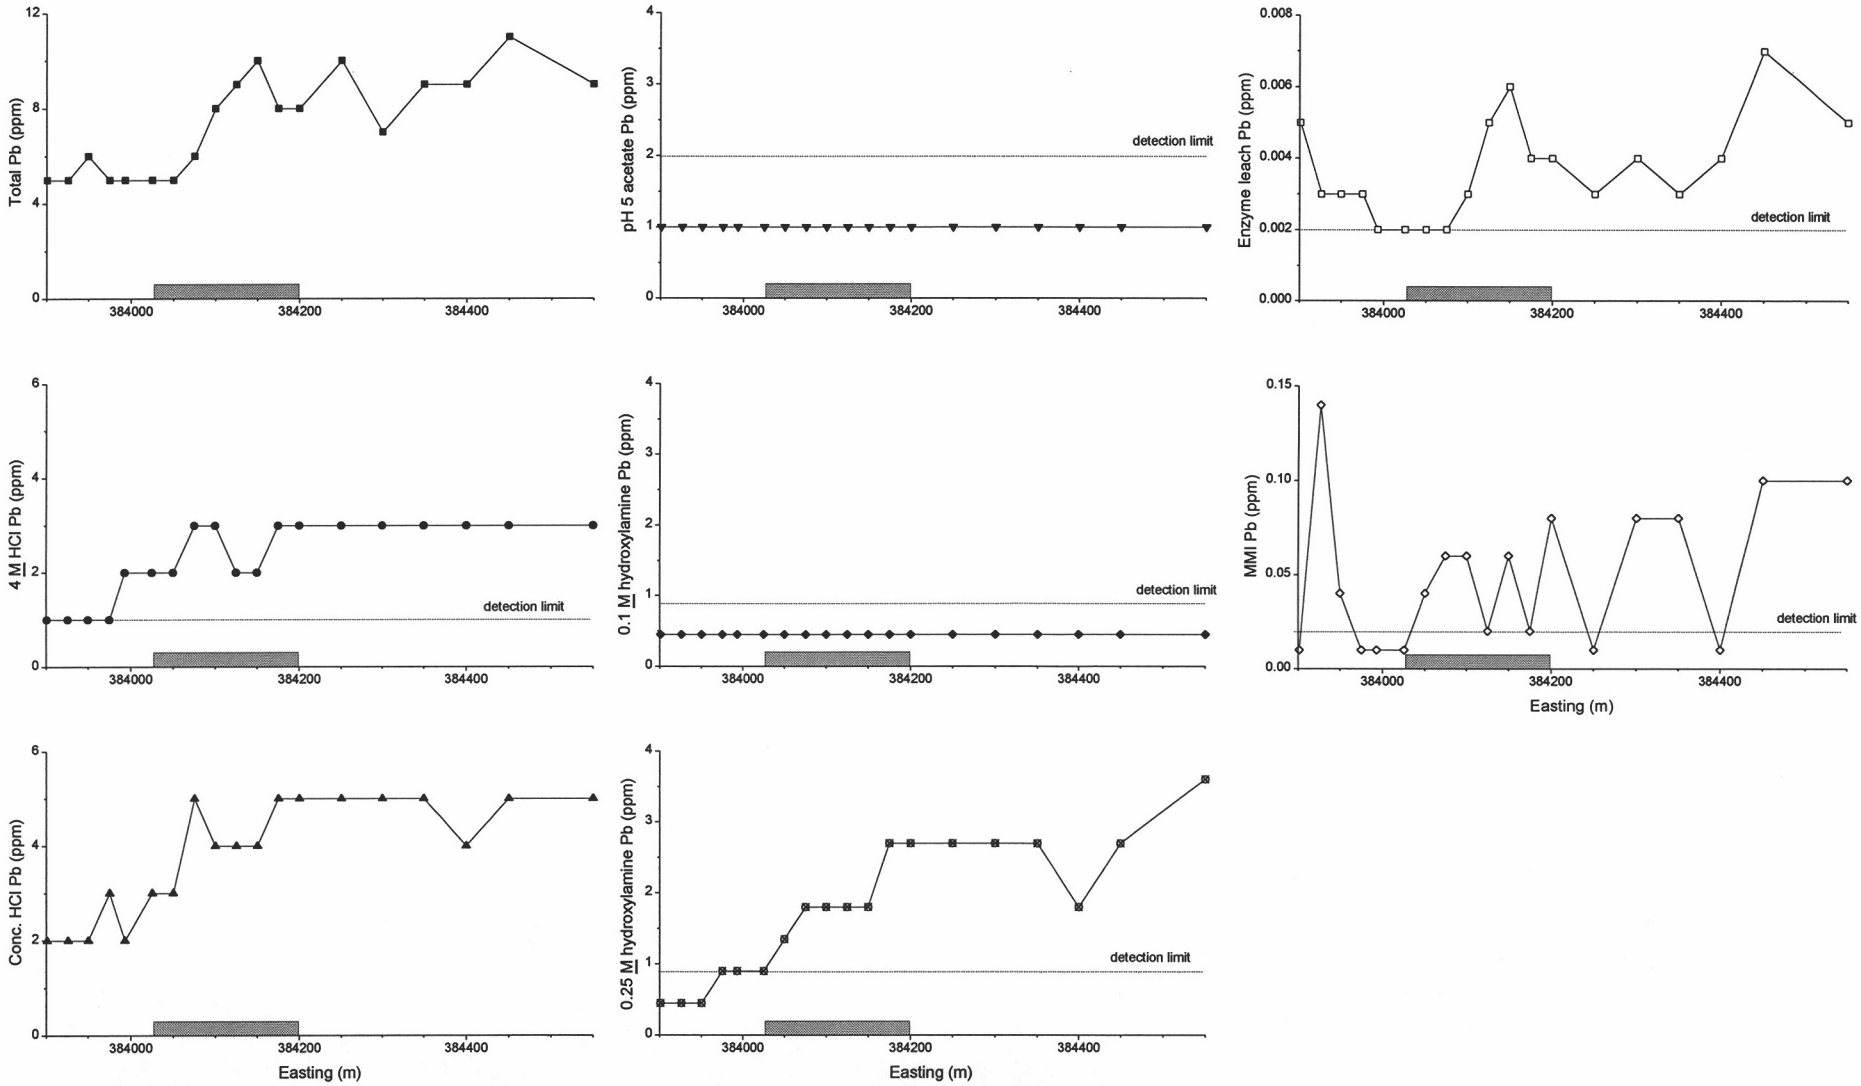

Figure A13.11: Total and extractable Pb from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).

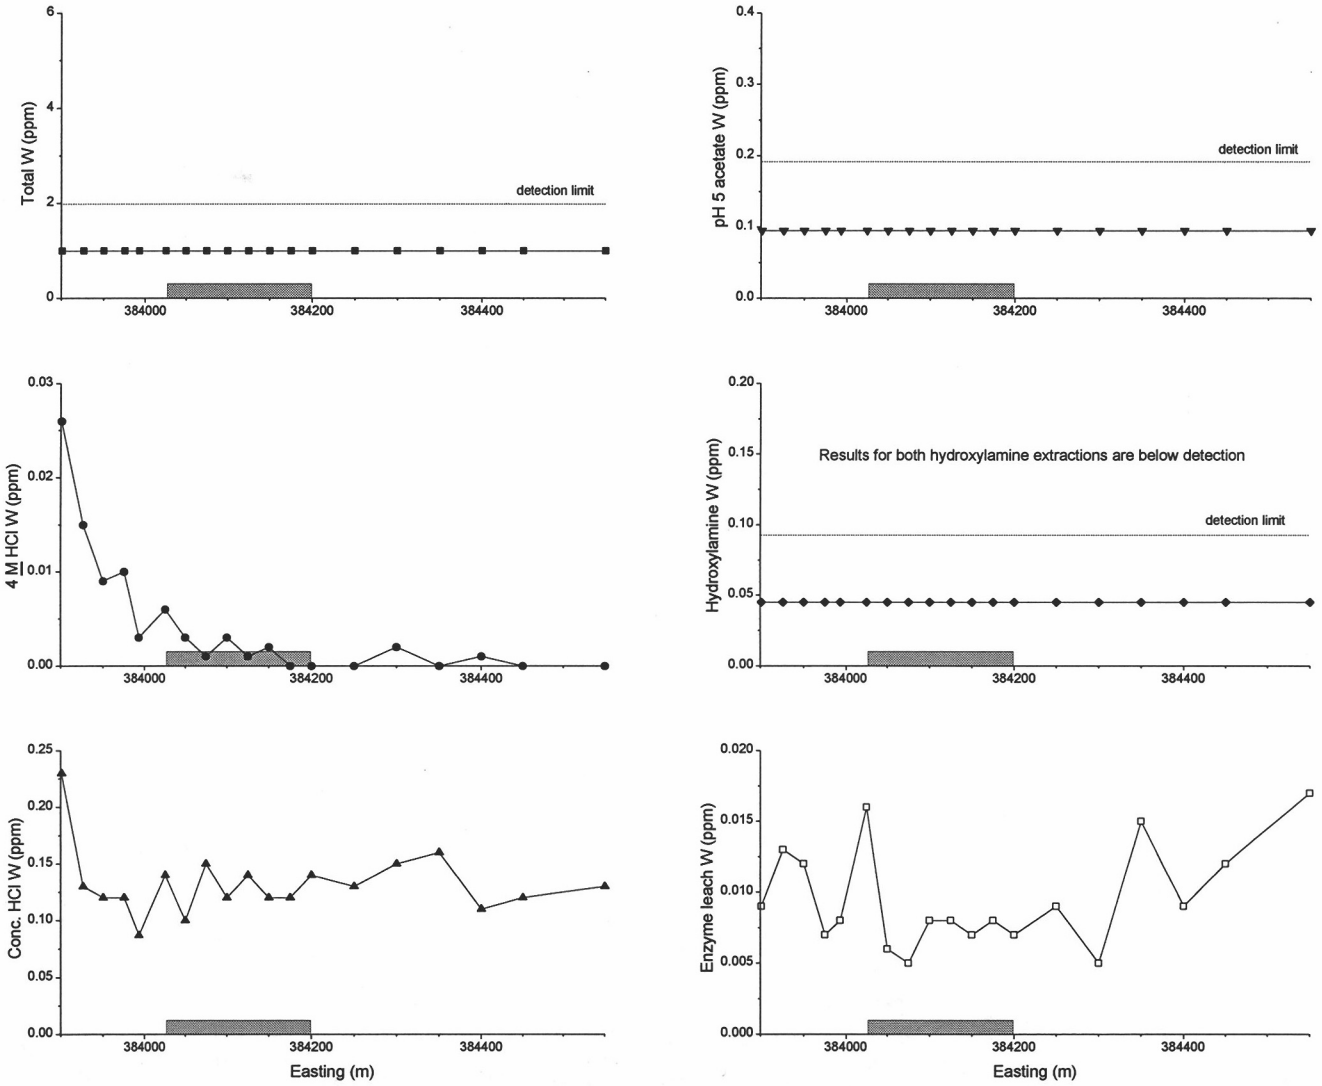

Figure A13.12: Total and extractable W from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).

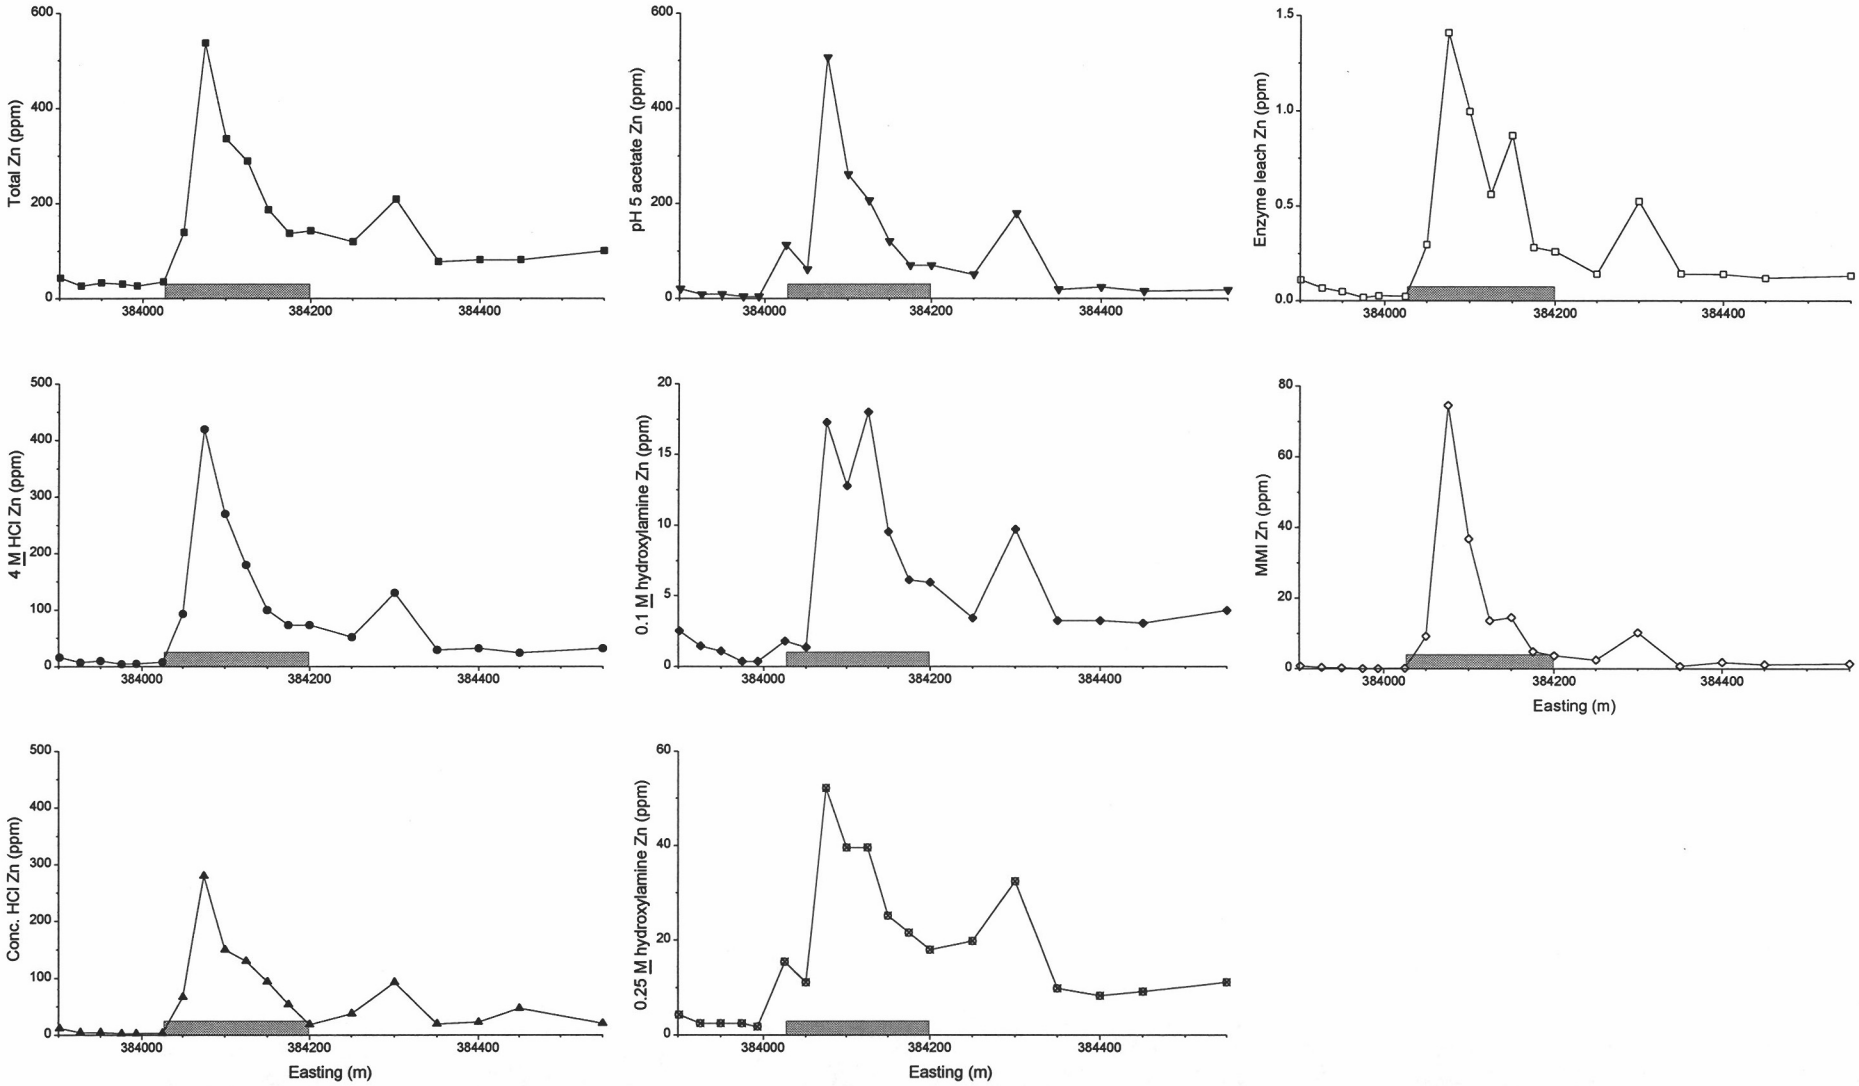

Figure A13.13: Total and extractable Zn from Apollo line 526080N.
(Shaded area represents Au mineralization in Archaean).
